

Exam 1 : Feb 20.

Saree Patil will hold OT on Tue.

Trees

Ex: For a  $n$ -vertex graph  $G$ , the

following are equivalent and characterize

trees with  $n$  vertices.

- (1)  $G$  is a tree. → connected, acyclic
- (2)  $G$  is connected & has exactly  $n-1$  edges
- (3)  $G$  is minimally connected, i.e.,  $G$  is connected but  $G - e$  is disconnected for every edge  $e \in G$ .
- (4)  $G$  contains no cycle but  $G + \{x, y\}$

does for any two non-adjacent vertices  $x, y \in G$ .

(5) Any two vertices in  $G$  are linked by a unique path in  $G$ .

(1)  $\Rightarrow$  (2)  $\Rightarrow$  (3)  $\Rightarrow$  (4)  $\Rightarrow$  (5)  $\Rightarrow$  (1).

(2)  $\Rightarrow$  (3)

$G$  is connected & has exactly  $n-1$  edges

$\Downarrow$

$G$  is minimally connected, i.e.,  $G$  is connected but  $G-e$  is disconnected for every edge  $e \in G$ .

Proof  $G$  is connected  $\checkmark$

let  $e$  be an arbitrary but particular edge in  $G$ . let  $G' = G - e$ .

It remains to show that  $G'$  is not connected.

$G'$  has  $n$  vertices &  $n-2$  edges.

We proved in class that a

connected graph with  $n$  vertices

must have  $\geq n-1$  edges. Thus

$G'$  is not connected.

(3)  $\Rightarrow$  (4)

$G$  is minimally connected, i.e.,  $G$  is connected but  $G - e$  is disconnected for every edge  $e \in G$ .

$\Downarrow$

$G$  contains no cycle but  $G + \{x, y\}$

does for any two non-adjacent vertices  $x, y \in G$ .

We will first prove that  $G$  is connected. We will prove this by proving the contrapositive.

Let  $C$  be a cycle in  $G$ .

Let  $e = (u, v) \in C$ . Let

$G' = G - e$ .  $G'$  is connected.

We now want to show that

if we add  $\{x, y\}$  b/w

non-adj. vertices  $x$  &  $y$  in  $G$

then  $G$  will contain a cycle.

Let  $x$  &  $y$  be any pair  
of non-adj vertices in  $G$ .

Since  $G$  is connected there  
must be a path  $P$  b/w

$x$  &  $y$  in  $G$ .

$P + e$  forms a cycle.

(4)  $\Rightarrow$  (5)

$G$  contains no cycle but  $\left[ G + \{x, y\} \right]$

does for any two non-adjacent vertices

$x, y \in G.$

Any two vertices in  $G$  are linked by a unique path in  $G$ .

T.P.T

$\geq 1$  path b/w any two vertices in  $G$ .

$u, v$  : arb. but part. vertices.

Can I :  $u$  &  $v$  are adjacent

Can II :  $u$  &  $v$  are non-adj.

Add  $(u, v)$  creates a cycle.

Thus  $u \rightsquigarrow v$  path must exist.

T.P.T exactly one path exists  
b/w  $u$  &  $v$ .

- more than one path b/w

$u$  &  $v$  will create a

cycle; thereby proving

the contrapositive.

$\rho^u$

(5)  $\Rightarrow$  (1)

Any two vertices in  $G$  are linked  
by a unique path in  $G$ .

$G$  is a tree.

connected

acyclic

## Spanning trees.

$H = (V_H, E_H)$  is a spanning subgraph of  $G = (V, E)$  if

$$V_H = V.$$

$T = (V_T, E_T)$  is a spanning tree of  $G = (V, E)$  if

- $T$  is a spanning subgraph of  $G$
- $T$  is a tree.

not a spanning subgraph of  $G$ .

$H$ : spanning tree of  $G$ .

Ex: Every connected graph  
 $G = (V, E)$  contains a  
spanning tree.

Proof: Let  $T$  be a  
minimally connected spanning  
subgraph of  $G$ . By the  
equivalence of (i) & (iii) in  
the previous lemma,  $T$   
is a tree. Thus  $T$  is  
a spanning tree of  $G$ .

It remains to show that  
 $T$  (minimally connected  
spanning subgraph of  $G$  exists).

Construct  $T$  as follows.  
for each edge  $e \in G$ :

"Do I need you?"

↳ After removing  $e$   
does the graph

if Yes : become disconnected?

keep it .

else

remove it .

## Rooted Trees .

- Tree with

a root .

root

children of a node.

parent

ancestor

descendant

Siblings

height

f is an ancestor of c,

c is a parent of d

f is a parent of c

of b.

Height of a rooted tree is the length of the longest path from root to a leaf. or  $H = \text{largest level}$ .

### Binary tree

- rooted tree in which each node has  $\leq 2$  children.

1 ~~2~~  $\rightarrow$  1  $2^0 + 2^1 + 2^2 + 2^3$

$$h \downarrow \begin{array}{c} \diagup \quad \diagdown \\ \circ \quad \circ \\ \diagdown \quad \diagup \quad \diagdown \quad \diagup \\ \circ \quad \circ \quad \circ \quad \circ \end{array} \rightarrow \downarrow 3 \quad = 2^4 - 1 = \boxed{15}$$

## Graph Coloring.

A graph  $G$  admits a  $k$ -coloring  
iff there exists a coloring of vertices  
of  $G$  using  $k$  colors s.t.

$\forall (u, v) \in E$ ,  $u$  &  $v$  are colored

differently.

$G$  is 3-colorable.

$$\rightarrow \chi(G) = 3.$$

Chromatic index of  $G$  ( $\chi(G)$ ) is

the min. # colors needed to color  $G$ .

12-2 Mon

3-5 T

2-4 Mon

~~A~~ bipartite graph is  
a graph that is 2-colorable.

$G$  is bipartite iff  
 $G$  contains no odd

Cycles.

Lemma: Let  $G$  be a graph with maximum degree  $\Delta$ . Then  $G$  is  $(\Delta+1)$ -colorable.

Proof: Induction on  $n$ .

IH: Assume that the claim holds when  $n=k$ , for some int  $k \geq 1$ .

BC: • 1 color suffices.

IS: Want to prove the claim when

$n=k+1$ . Let  $G$  be a graph

on  $k+1$  vertices. Let  $G$  have a

max degree of  $\Delta(G)$ . Then, we

want to show that  $G$  is

$(\Delta+1)$ -colorable.

let  $G' = G - v$ , where  $v$  is  
any vertex in  $G$ .

By IH;  $G'$  can be colored

using  $\leq \Delta(G') + 1$  colors.

$\leq \underline{\underline{\Delta(G) + 1}}$  colors.

Add  $v$  to  $G'$  to obtain  $G$ .

$$\deg(v) \leq \Delta.$$

$\therefore \leq \underline{\Delta}$  colors are

used by neighbors of  $v$

Then atleast one color

is unused by neighbors

of  $v$ . We can use

that color to color  $v$ .
