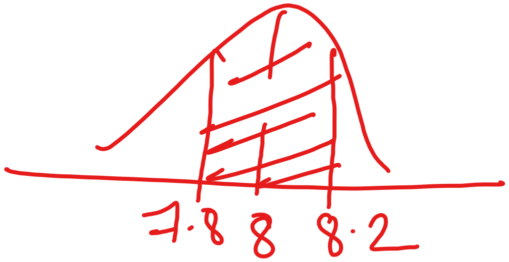
- Suppose a population has mean $\mu = 8$ and standard deviation $\sigma = 3$. Suppose a random sample of size $n = 36$ is selected.
- What is the probability that the sample mean is between 7.8 and 8.2???????

$\mu$

$P(7.8 < x < 8.2)$

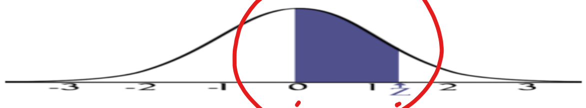


Solution:

- Even if the population is not normally distributed, the central limit theorem can be used ($n > 30$)
- … so the sampling distribution of $\bar{x}$ is approximately normal
- … with mean $\mu_{\bar{x}} = 8$
- …and standard deviation

$$\sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}} = \frac{3}{\sqrt{36}} = 0.5$$

$$\sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}$$



# STANDARD NORMAL TABLE (Z)

Entries in the table give the area under the curve between the mean and $z$ standard deviations above the mean. For example, for $z = 1.25$ the area under the curve between the mean (0) and $z$ is 0.3944.

| z | 0.00 | 0.01 | 0.02 | 0.03 | 0.04 | 0.05 | 0.06 | 0.07 | 0.08 | 0.09 |

$$\frac{\bar{x} - \mu}{\sigma_{\bar{x}}}$$

R → 0.4
C → 0.00

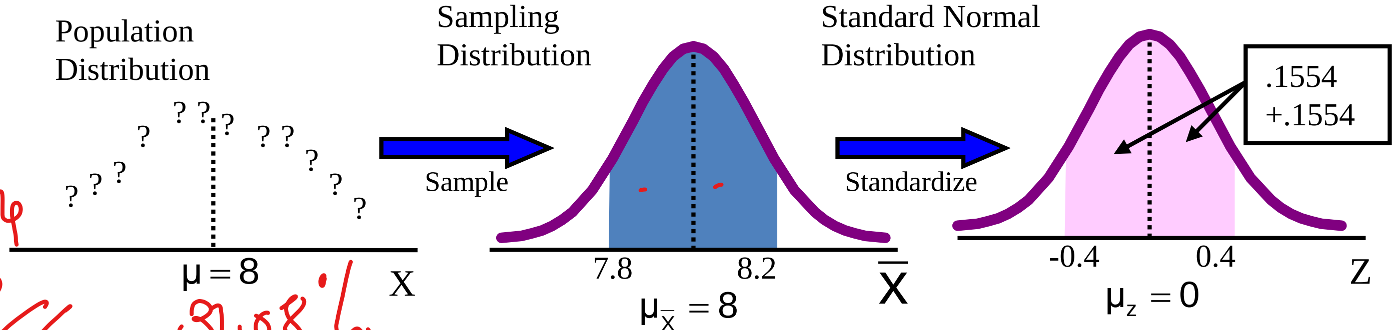
$$P(7.8 < \bar{X} < 8.2) = P\left(\frac{7.8-8}{3/\sqrt{36}} < \frac{\bar{X}-\mu}{\sigma/\sqrt{n}} < \frac{8.2-8}{3/\sqrt{36}}\right)$$

$$= P(-0.4 < Z < 0.4) = 0.3108$$

0.1554 + 0.1554

= 0.3108

31.08%



$n$

Ex) In a sample of 25 observations from a normal distribution with mean 98.6 and standard deviation 17.2 is taken.

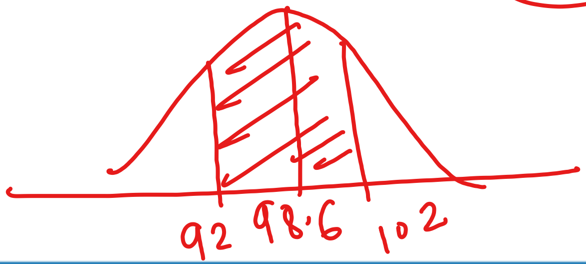
$\mu$ $\sigma$

a) What is $P(92<\bar{x}<102)$?

b) Find the corresponding probability given a sample of 36.

$n_1 = 25$

$n_2 = 36$



(a) $n = 25 \quad \mu = 98.6 \quad \sigma = 17.2 \quad \sigma_{\bar{x}} = \sigma/\sqrt{n} = 17.2/\sqrt{25} = 3.44$

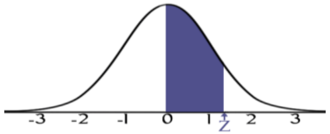
$$P(92 < \bar{x} < 102) = P\left(\frac{92 - 98.6}{3.44} < \frac{\bar{x} - \mu}{\sigma_{\bar{x}}} < \frac{102 - 98.6}{3.44}\right)$$

$$= P(-1.92 < z < 0.99) = 0.4726 + 0.3389 = 0.8115$$

(b) $n = 36 \quad \sigma_{\bar{x}} = \sigma/\sqrt{n} = 17.2/\sqrt{36} = 2.87$

$$P(92 < \bar{x} < 102) = P\left(\frac{92 - 98.6}{2.87} < \frac{\bar{x} - \mu}{\sigma_{\bar{x}}} < \frac{102 - 98.6}{2.87}\right)$$

$$= P(-2.30 < z < 1.18) = 0.4893 + 0.3810 = 0.8703$$



## STANDARD NORMAL TABLE (Z)

Entries in the table give the area under the curve between the mean and $z$ standard deviations above the mean. For example, for $z = 1.25$ the area under the curve between the mean (0) and $z$ is 0.3944.

Ex) Mary Bartel, an auditor for a large credit card company, knows that, on average, the monthly balance of any given customer is $\mu$ \$112, and the standard deviation is \$ 56. If Mary audits 50 randomly selected accounts, what is the probability that the sample average monthly balance is

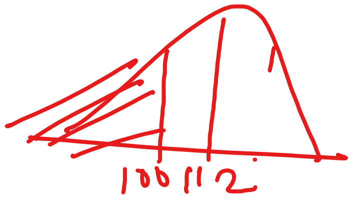
(a) Below \$100?

(b) Between \$100 and \$130

$\mu = 112 \quad \sigma = 56 \quad n = 50$

$P(x < 100)$

$P(100 < x < 130)$



$0.5 - (z)$

The sample size of 50 is large enough to use the central limit theorem.

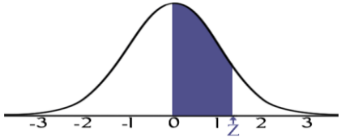
$\mu = 112 \quad \sigma = 56 \quad n = 50 \quad \sigma_{\bar{x}} = \sigma/\sqrt{n} = 56/\sqrt{50} = 7.920$

Z: value

(a) $P(\bar{x} < 100) = P\left(\frac{\bar{x}-\mu}{\sigma_{\bar{x}}} < \frac{100-112}{7.920}\right) = P(z < -1.52) = 0.5 - 0.4357 = \underline{\underline{0.0643}}$

(b) $P(100 < \bar{x} < 130) = P\left(\frac{100-112}{7.920} < \frac{\bar{x}-\mu}{\sigma_{\bar{x}}} < \frac{130-112}{7.920}\right)$

$= P(-1.52 < z < 2.27) = 0.4357 + 0.4884 = \underline{\underline{0.9241}}$



## STANDARD NORMAL TABLE (Z)

Entries in the table give the area under the curve between the mean and $z$ standard deviations above the mean. For example, for $z = 1.25$ the area under the curve between the mean (0) and $z$ is 0.3944.

| z | 0.00 | 0.01 | 0.02 | 0.03 | 0.04 | 0.05 | 0.06 | 0.07 | 0.08 | 0.09 |

Ex: Jonida Marinez, researcher for the Columbian Coffee Corporation, is interested in determining the rate of coffee usage per household in the United States. She believes that yearly consumption per household is normally distributed with an **unknown** mean μ and a standard deviation of about 1.25 pounds.

a) If Martinez takes a sample of 36 households and records their consumption of coffee for one year, what is the probability that the **sample mean is within one-half pound of the population mean**?

b) How large a sample must she take in order to **be 98 percent** certain that the sample mean is within one-half pound of the population mean?

$$(a) \quad \sigma = 1.25 \qquad n = 36 \qquad \sigma_{\bar{x}} = \sigma/\sqrt{n} = 1.25/\sqrt{36} = 0.2083$$

$$P(\mu - 0.5 \le \bar{x} \le \mu + 0.5) = P\left(\frac{-0.5}{0.2083} \le \frac{\bar{x} - \mu}{\sigma_{\bar{x}}} \le \frac{0.5}{0.2083}\right)$$

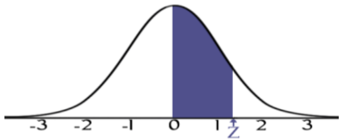
$$= P(-2.4 \le z \le 2.4) = 0.4918 + 0.4918 = 0.9836$$

$$(b) \quad 0.98 = P(\mu - 0.5 \le \bar{x} \le \mu + 0.5) = P\left(\frac{-0.5}{1.25/\sqrt{n}} \le z \le \frac{0.5}{1.25/\sqrt{n}}\right)$$

$$= P(-2.33 \le z \le 2.33)$$

$$\text{Hence, } 2.33 = \frac{0.5}{1.25/\sqrt{n}} = 0.4\sqrt{n} \quad \text{and} \quad n = (2.33/0.4)^2 = 33.93.$$

**She should sample at least 34 households**



## STANDARD NORMAL TABLE (Z)

Entries in the table give the area under the curve between the mean and $z$ standard deviations above the mean. For example, for $z = 1.25$ the area under the curve between the mean (0) and $z$ is 0.3944.

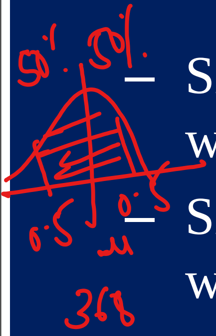
# Determining An Interval Including A Fixed Proportion of the Sample Means

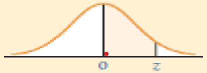
Example: Find a symmetrically distributed interval around μ that will include 95% of the sample means when μ = 368, σ = 15, and n = 25.



- Since the interval contains 95% of the sample means 5% of the sample means will be outside the interval

$5/2 = 2.5\%$

- Since the interval is symmetric 2.5% will be above the upper limit and 2.5% will be below the lower limit.
- From the standardized normal table, the Z score with 2.5% (0.0250) below it is -1.96 and the Z score with 2.5% (0.0250) above it is 1.96.



SECOND DECIMAL PLACE IN $z$

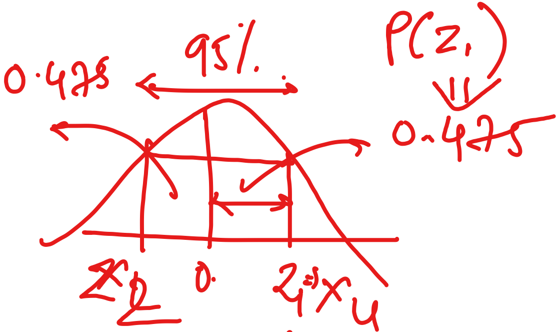
$$\frac{0.95}{2} = 0.475$$



$\downarrow$ 1.96

$z_1 \longrightarrow \bar{x}_U$ upper

$z_2 \longrightarrow x_L$ lower

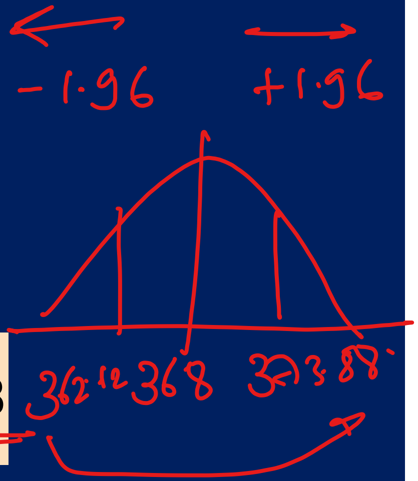
# Determining An Interval Including A Fixed Proportion of the Sample Means

- Calculating the lower limit of the interval

$$\bar{X}_L = \mu - Z\frac{\sigma}{\sqrt{n}} = 368 + (-1.96)\frac{15}{\sqrt{25}} = 362.12$$

- Calculating the upper limit of the interval

$$\bar{X}_U = \mu + Z\frac{\sigma}{\sqrt{n}} = 368 + (1.96)\frac{15}{\sqrt{25}} = 373.88$$



- 95% of all sample means of sample size 25 are between 362.12 and 373.88

## Ex: How is the std error of the mean affected by n, when increased from 25 to 100.

$$\sigma_{\overline{x}} = \frac{\sigma}{\sqrt{n}}$$

when n =25 , $\sigma_{\overline{x}}$ = 15/3= 3

when n =100 , $\sigma_{\overline{x}}$ = 15/10= 1.5

# Population Proportions

Population mean

$\pi$ = the proportion of the population having some characteristic

sample $\rightarrow$ p ] proportion

Popul $\rightarrow$ $\pi$

- Sample proportion ( p ) provides an estimate of $\pi$:

$$p = \frac{X}{n} = \frac{\text{number of items in the sample having the characteristic of interest}}{\text{sample size}}$$

- $0 \leq p \leq 1$
- p is approximately distributed as a normal distribution when n is large

(assuming sampling with replacement from a finite population or without replacement from an infinite population)

# Sampling Distribution of p

mean $\bar{x}$

Proportion

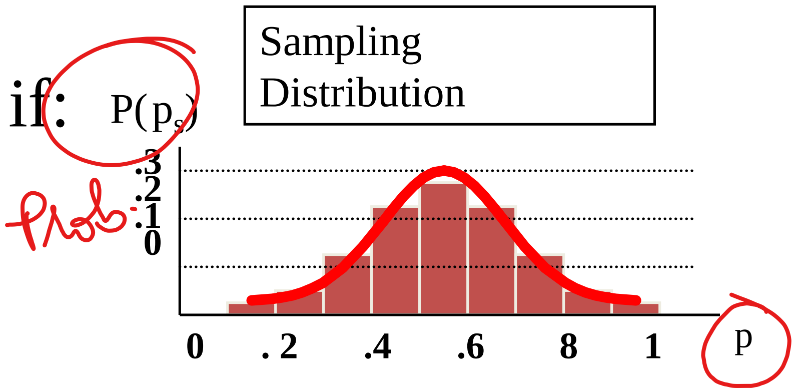
p

- Approximated by a normal distribution if:

$$n\pi \geq 5$$

and

$$n(1-\pi) \geq 5$$



where

$$\mu_p = \pi$$

and

$$\sigma_p = \sqrt{\frac{\pi(1-\pi)}{n}}$$

(where $\pi$ = population proportion)

$$\sigma_x = \frac{\sigma}{\sqrt{n}}$$

# Z-Value for Proportions

Standardize p to a Z value with the formula:

$$Z = \frac{p - \pi}{\sigma_p} = \frac{p - \pi}{\sqrt{\dfrac{\pi(1-\pi)}{n}}}$$

$Z = \frac{\bar{x} - \mu}{\sigma_{\bar{x}}}$.

$Z = \frac{p - \pi}{\sigma_p}$.

# Example

- If the true proportion of voters who support Proposition A is $\pi = 0.4$, what is the probability that a sample of size 200 yields a sample proportion between 0.40 and 0.45?

n

$P_1$ $P_2$

- i.e.: **if $\pi = 0.4$ and n = 200, what is**

  **$P(0.40 \le p \le 0.45)$ ?**

Z value

# Example

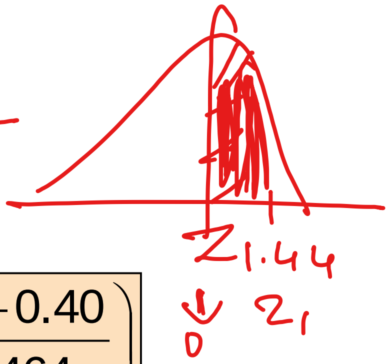
*(continued)*

- **if $\pi = 0.4$ and $n = 200$, what is $P(0.40 \le p \le 0.45)$ ?**

n = 200

Find : $\sigma_p$

$$\sigma_p = \sqrt{\frac{\pi(1-\pi)}{n}} = \sqrt{\frac{0.4(1-0.4)}{200}} = 0.03464$$



Convert to standardized normal:

$$P(0.40 \le p \le 0.45) = P\left(\frac{0.40-0.40}{0.03464} \le Z \le \frac{0.45-0.40}{0.03464}\right)$$

$$= P(0 \le Z \le 1.44)$$
