

## Sem 4 → Analysis of Algorithm

Algorithms → It is finite set of Instruction.

- Features →
- (1) Input → One or more external quantities supplied.
  - (2) Output → At least one output
  - (3) Definite → Instructions must be clear and unambiguous.

### Algo' To perform Binary Search.

Input: An array of  $n$  elements, and  $X$  to search.

Op → 1 or 0  
(Hai) (wahi)

Process    Let  $A$  be sorted → sort( $A$ ) } Ambiguity

- (1) Finite → Algo must terminate after finite number of steps.

- (2) Effective → Must satisfy the goal.

## Analyze the Algorithm

Complexity → Time Complexity =  $T(P)$  → Time req to solve given problem  $P$  for input size  $n$ .  
 In Analysis Part →  $T.C \propto$  No of comparison in Algo.  
 → Processor Time.  
 → Understanding → Order of Growth

(order of growth)

Space Complexity → Amnt of Primary memory (RAM) needed to solve a problem of size  $n$ .  
 → We also express it in terms of order of growth.

Vimp  
Order of growth → If input  $n$  time se increase hogta to Time required Kitne time se increase hogta.

$$\text{Order of growth} = n^2$$

Time req.

If  $n=100$  → 100 ms.  
 $n=1000$  →  $100 \times 100 = 10000 \text{ ms}$

Again

$n$  is increased by 10 times

$\frac{\text{Input}}{n=100} \rightarrow \text{Time Req}$   
 $n=1000 \rightarrow 1000 \text{ ms}$

Order of growth  $\Rightarrow$  10 times

### Analysis $\rightarrow$ Type of Analysis.

#### A Posteriori Analysis

1. Here analysis is done only after the execution on machine.
2. It depends on Programming language and Hardware of the System.
3. It will give exact answer (based on real time)
4. The Answer can change from System to System.
5. It is relative Analysis
6. It does not use Asymptotic Notations.

#### A Priori Analysis

1. Analysis done before the execution of Algo in system.
2. It is Independent of language and hardware of the system.
3. It will give approximate Answer (based on Assumption).
4. Answer remains same on all the system.
5. It is absolute analysis
6. It uses Asymptotic Notations
  - $O \Rightarrow$  Big O Notation
  - $\Omega \Rightarrow$  Omega Notation
  - $\Theta \Rightarrow$  Theta Notation

Time Complexity.  $\rightarrow T(p) \Rightarrow$  Time req for an Algorithm to give  $o(p)$ .  
 wrt given input size.  
 $\Rightarrow$  gt is Processor Time.

$$\text{Time Complexity} = \begin{matrix} \text{Compile Time} \\ (\text{constant}) \end{matrix} + \begin{matrix} \text{Run Time} \\ (\text{input dependent}) (\underline{\text{variable}}) \end{matrix}$$

$\downarrow$   
 gt does not  
 depend on input  
 characteristic

$\downarrow$   
 gt depends on  
 input characteristic

RunTime depends on input characteristic ( $t_p$ )

 (constant)

$\uparrow$   
 Runtime.

```

int main ()
{
    int n, *p, i;
    printf("Enter value of n\n");
    scanf("%d", &n);
    p = (int *) malloc(sizeof(int));
    printf("Enter elements in array\n");
    for (i=1; i<=n; i++)
        scanf("%d", (p+i));
    or
    scanf("%d", &p[i]);
}
    
```

Here  
 Compile Time = Constant  
 = Does not change  
 with n.

Run Time = Variable Component  
 = varies with n.

}

How to Represent/Express Time Complexity of Algorithm →

## Asymptotic Notations →

- Asymptotic Notations  $\rightarrow$

  - \* These notations denote Asymptotic Analysis of Algorithms.
  - \* Asymptotic Analysis  $\Rightarrow$  Analysis performed for very large value of  $n$  is known as Asymptotic Analysis.
  - \* To analyze the efficiency of an Algorithm if it is not necessary to conduct detailed analysis of running time, but we emphasize more on finding "how Running Time increases with increase in input" (this is known as Order of Growth)

Uddeshya !!

"Jab main input ka size 'x' time se increase karong  
toh Execution time kitne time se increase hoga "

Ex → if input size is 100 and time req → 0.5 ms  
 then if input size is 500 → ?

Question Arises > What is Order of Growth [ No of steps ]

(one) Let  $S(n) \rightarrow \underline{\underline{n^2}}$  [Quadratic Order of Growth].

$$t_{\text{max}} = \sqrt{\frac{2}{g}} \ln(\frac{v_0}{g}) \text{ sec}$$

(one 1) let say  $\rightarrow$  quadratic ...  
 then  
 input size = 100  $\rightarrow$  No of steps =  $n^2 \Rightarrow (100)^2$  steps

for  $(100)^2$  steps  $\rightarrow 0.5\text{ms}$

input size = 500  $\rightarrow$  No of steps =  $(500)^2$ .

for  $(100)^2$  steps  $\rightarrow 0.5\text{ms}$   
 $(500)^2$  steps  $\rightarrow x.$

$$x = \frac{(500)^2 \times 0.5\text{ms}}{(100)^2} = \underline{\underline{12.5\text{ms}}}$$

(one 2) 1st order of growth =  $n$  [Linear Order of Growth]

for  $n = 100$   $\xrightarrow{\text{No of steps}}$  100  $\xrightarrow{\text{Time req}}$  0.5ms.

for  $n = 500$   $\xrightarrow{\quad}$  500  $\xrightarrow{\quad} x.$

$$\boxed{x = \frac{500 \times 0.5}{100} = \underline{\underline{2.5\text{ms}}}}$$

When we want to compare 2 algorithms w.r.t. the large input size, A useful methodology called "Order of growth" is used.

In Asymptotic Analysis, it is considered that an Algorithm  $\underline{A_1}$ 's better than better than  $\underline{A_2}$ , if Order of Growth of Running Time of  $\underline{A_1}$  is better (lower) than that of  $\underline{A_2}$ . Algorithm

$\therefore$  if order of growth of  $A_1 <$  Order of growth of  $A_2$   
then Algorithm  $A_1$  is better than  $A_2$ .

Let say Order of growth of  $A_1 \Rightarrow n$  [linear]  
and Order of growth of  $A_2 \Rightarrow n^2$  [quadratic]

$\therefore A_1$  is better than  $A_2$ .

\* Order of growth can be estimated by taking into account the dominant term of expression.

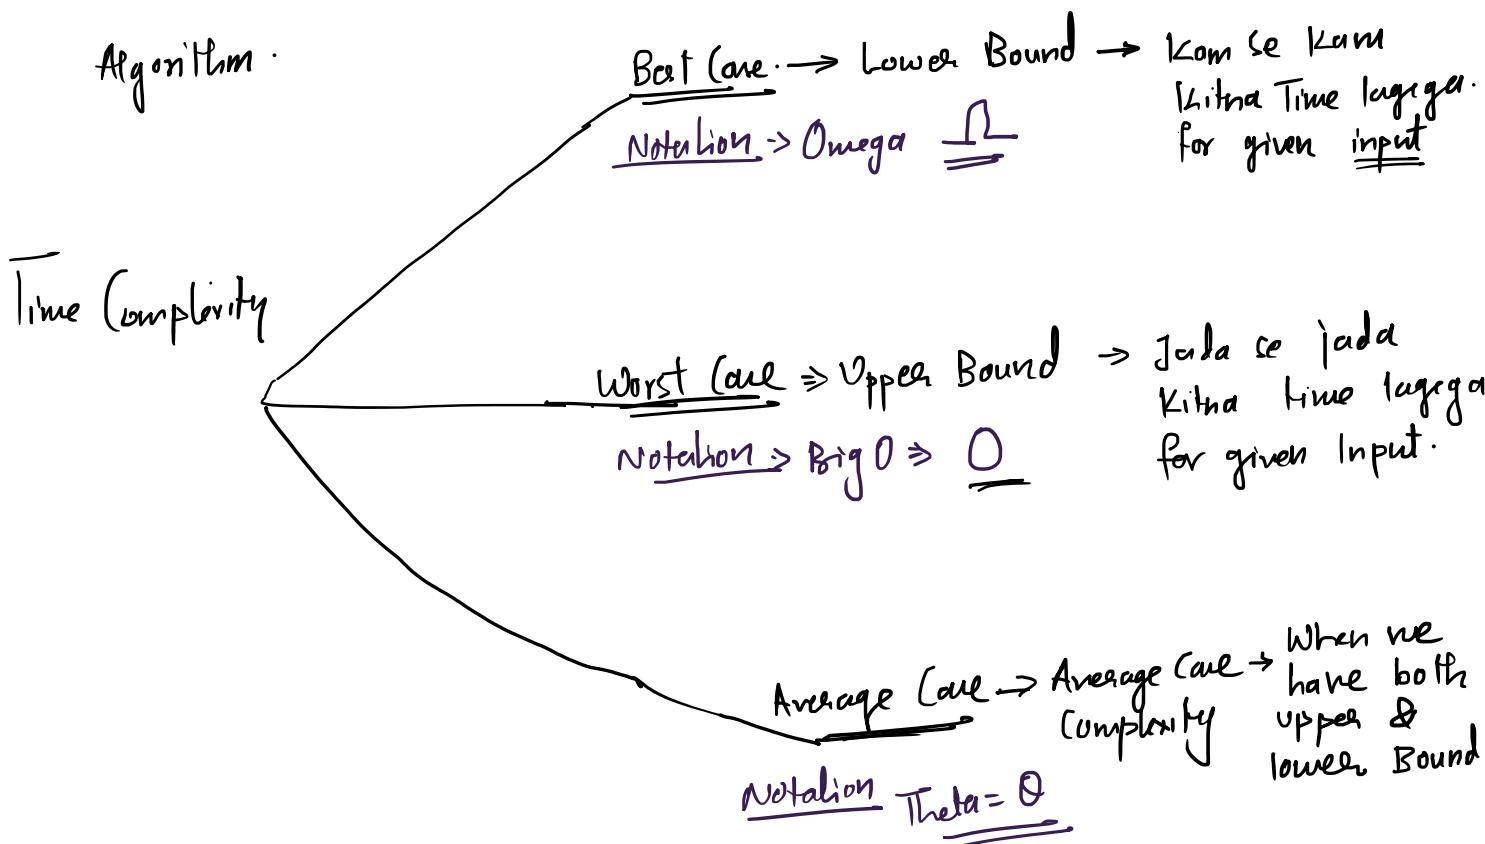

Consider. Exp is  $\underline{\underline{n^2 - 2n + 5}} \approx \underline{\underline{n^2}}$

for very large value of  $n$  (let say  $\underline{100000} \Rightarrow (100000)^2 - (2 \times 100000) + 5 \approx (100000)^2$ )

$\therefore$  for the exp  $n^2 - 2n + 5 \Rightarrow$  Order of Growth =  $\underline{\underline{n^2}}$ .

## VVImf Explain Asymptotic Notations.

- \* These are notations used to express the time complexity of algorithm.

Consider Bubble Sort  $\rightarrow$

```

for(i=0; i<n-1; i++)
    |
    for(j=0; j<n-1; j++)
        |
        if(a[j] > a[j+1])
            |
            t=a[j];
            a[j]=a[j+1];
            a[j+1]=t;
            |
            ? ? ?
    }
}

```

No of comparison.

Assume time req for swapping is negligible

Consider Input:

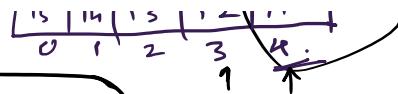

(n=5)

15	14	13	12	11
0	1	2	3	4

$$\left| \begin{array}{l} i=1 \\ i=2 \\ i=3 \end{array} \right|$$

Consider Input.

This could be Worst Input -

$$\begin{array}{c|c|c|c} i=0 & i=1 & i=\alpha & \\ \hline j=0, 1, 2, 3 & \cancel{j=0-3} & j=0-3 & j=0-3 \end{array}$$

## 1st Iteration

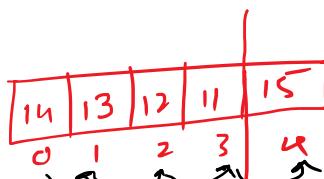

$$\underline{i=0}$$

$j=0$   
 $a[0] > a[1]$  Yes - swap

j=1  
a[1] > a[2] Yes - swap

$j = 2$   
 $a[2] > a[3]$  Yes - Swap

$$j=3$$

## 4 Comparison

[n=5]

When  $i=0 \rightarrow 4$  comp.  
 $i=1 \rightarrow 4$  comp  
 $i=2 \Rightarrow 4$  comp.  
 $i=3 \Rightarrow 4$  comp.  
 4 iterations.

for r

$$q=2 \longrightarrow \frac{(n-1)}{(n-1)} \text{ comp}$$

4 comparison.  
(No Swapping)

$i=2$  -

4 comp  
(No Swapping)

$i=3$

4 comp  
(No Swapping)

$$\text{No of Comp} = (n-1) * (n-1) = n^2 - 2n + 1 = \underline{\underline{n^2}}$$

$\therefore$  Best Case Time Complexity =  $\underline{\underline{O(n^2)}}$ .

$\therefore$  For Bubble Sort

Best Case T.C  $\longrightarrow$   $\underline{\underline{O(n^2)}}$

Worst Case T.C  $\longrightarrow$   $O(n^2)$

Avg Case T.C  $\longrightarrow$   $\underline{\underline{O(n^2)}}$

## Big O Notation $\Rightarrow$

$\hookrightarrow$  It is used to represent/express Upper Bound of Algorithm.

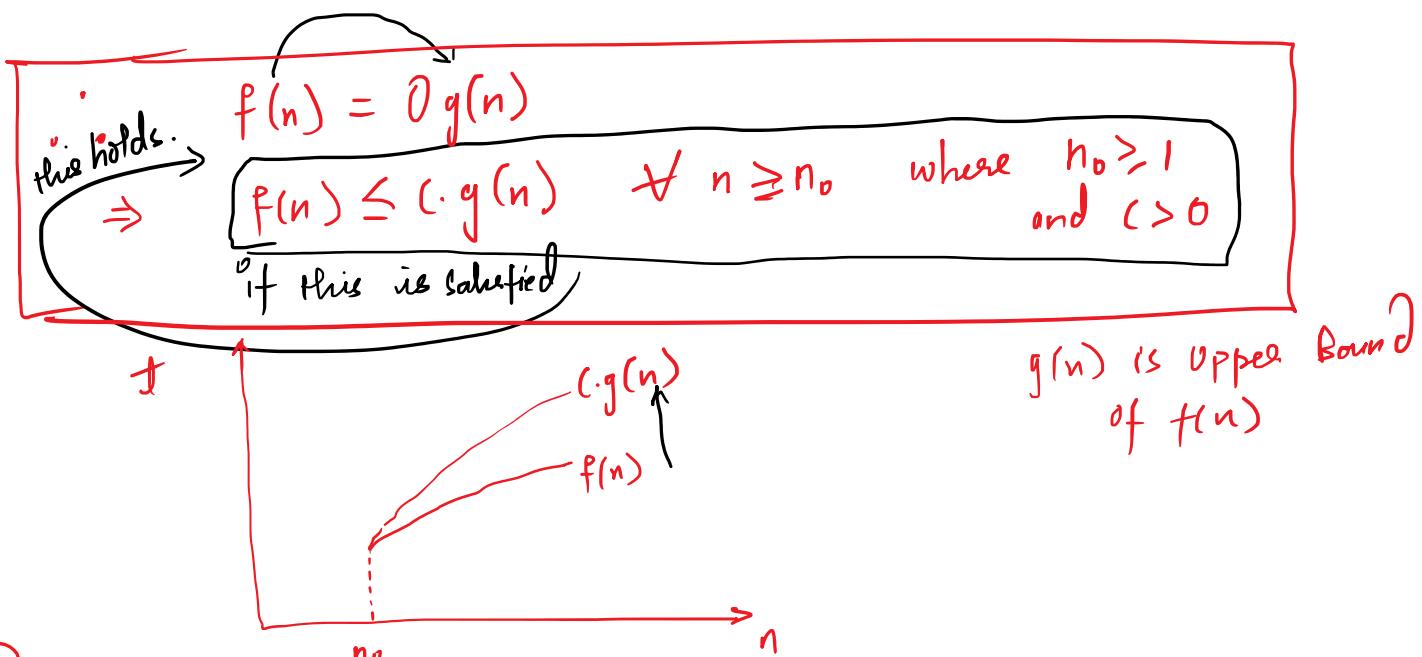

$\hookrightarrow$  It represents Worst Case Time Complexity of Algorithm.

We have  $f(n) = \underline{\underline{O(g(n))}}$

i.e.  $f(n)$  is Big O of  $g(n)$ .

means  $f(n) \leq c \cdot g(n)$ .

where  $c$  is the constant  $> 0$  and  $n \geq n_0$  where  $n_0 \geq 1$

(1)

W.Say  $f(n) = 3n+2$   $g(n) = n$ , let  $c = 4$

$$\boxed{3n+2 \leq 4n}$$

this should be true for  $\forall n$

$n=1$

$$3(1)+2 \leq 4(1) \text{ false}$$

$n=2$

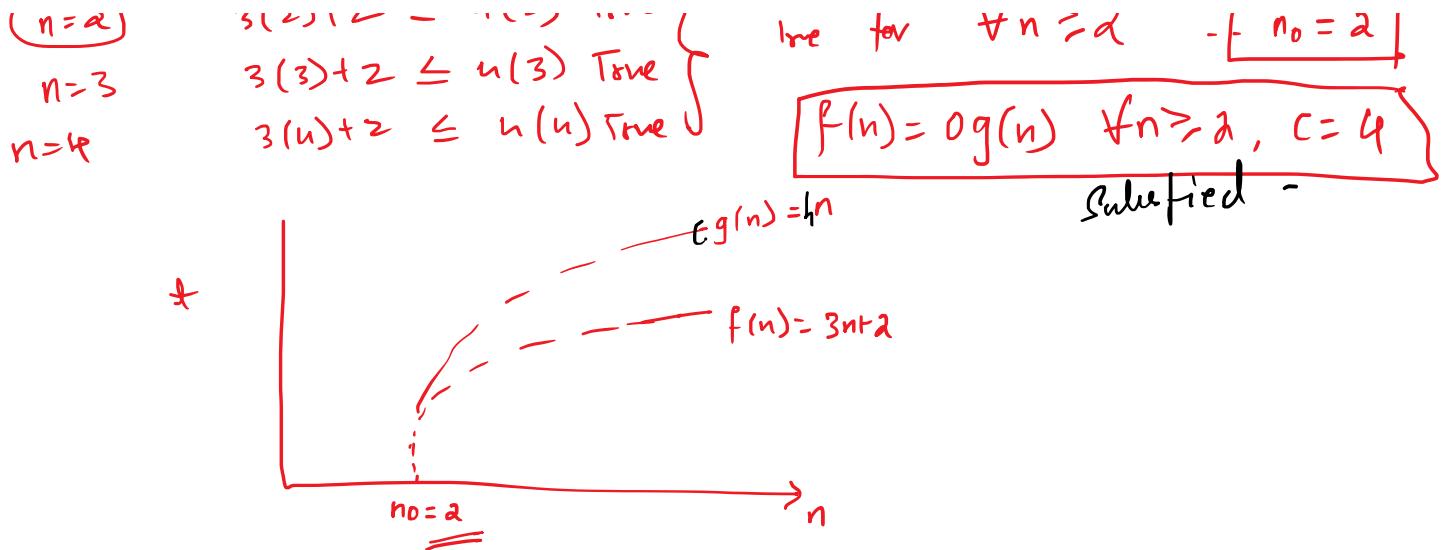

$$3(2)+2 \leq 4(2) \text{ True.}$$

$n=3$

$$3(3)+2 \leq 4(3) \text{ True.}$$

True for  $\forall n \geq 2$

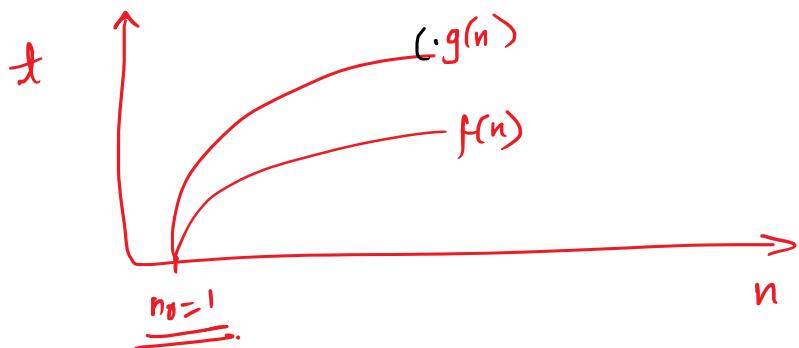

$$\boxed{n_0 = 2}$$

Consider  $f(n) = 3n+2, \quad g(n) = n$  let  $\underline{c=6}$

$\underline{n=1}$ 
 $\begin{cases} 3n+2 \leq 6n \\ 3(1)+2 \leq 6(1) \end{cases}$  True
 .  $\boxed{3n+2 \leq 6n \quad \forall n \geq 1}$

$\therefore$  Here  $f(n) = O(g(n)) \quad \forall n \geq 1, c=6$ 
 Note  $\underline{n_0=1}$ .

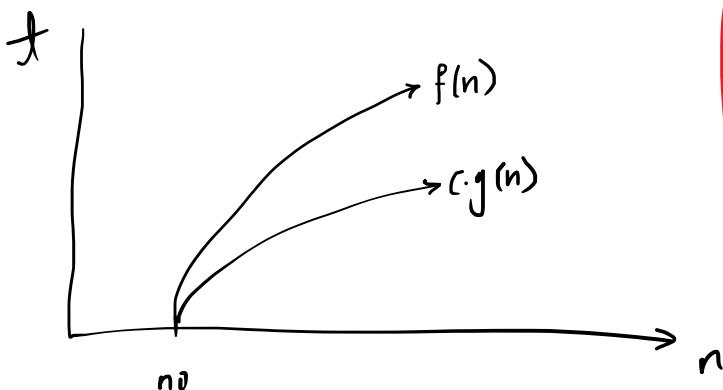

## Omega Notation ( $\Omega$ )

→ It is used to express/represent Best case/Lower Bound of Algorithm.

Algorithm :

$f(n) = \Omega g(n) \implies g(n)$  is lower bound of  $f(n)$ .

$$\boxed{f(n) \geq c \cdot g(n) \quad \forall n \geq n_0 \text{ where } c > 0 \text{ & } n_0 \geq 1}$$

[for this particular C  
the condn  $f(n) \geq c \cdot g(n)$   
must be true &  $n \geq n_0$ ]

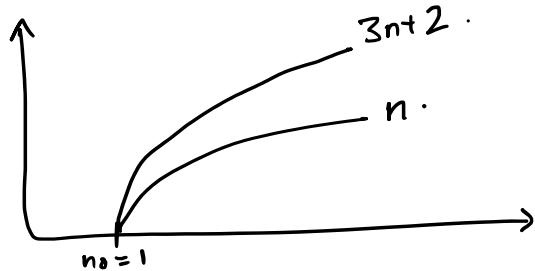

Consider  $f(n) = 3n + 2$        $g(n) = n \cdot \underline{\underline{c=1}}$

$$3n+2 \geq 1 \cdot n$$

$$\frac{n=1}{n=2}$$

$$\begin{aligned} 3(1)+2 &\geq 1 & \rightarrow \text{True} \\ 3(2)+2 &> 2 & \rightarrow \text{True} \end{aligned}$$

} Here  $n_0 = 1$

(d) Let  $f(n) = 3n + 2$        $g(n) = n \cdot \underline{\underline{c=6}}$

(a)  $W \quad T(n) = 2n + c$

$$3n+2 \geq 6n$$

this will not hold True

$$n=1 \quad 5 \geq 6 \quad \text{False}$$

$$n=2 \quad 8 \geq 12 \quad \text{False}$$

$$n=3 \quad 11 \geq 18 \quad \text{False}$$

### Average Case Complexity (Theta Θ) Notation:

Consider  $f(n) = \Theta g(n)$ . if there exists the constants  $c_1$  and  $c_2$  and  $n_0$  such that

$$c_1 \cdot g(n) \leq f(n) \leq c_2 \cdot g(n) \quad \text{for } n \geq n_0 \quad \text{where } \begin{cases} c_1, c_2 > 0 \\ n_0 \geq 1 \end{cases}$$

$$\begin{aligned} f(n) &= \underline{\Omega}(g(n)) & f(n) &= \overline{\Omega}(g(n)). \\ (\text{Best Case}) & & (\text{Worst Case}) & \end{aligned}$$

$$\Rightarrow \underline{\underline{f(n) = \Theta(g(n))}}$$

Consider  $f(n) = 3n+2$   
let  $g(n) = n$ .

Now  $\underline{\underline{3n+2 \geq 3n}} \quad \text{where } \begin{cases} c = 3 \\ n_0 = 2 \end{cases}$

$$\begin{aligned} 3n+2 &\leq 4n. \quad \text{where } \begin{cases} c = 4 \\ n_0 = 2 \end{cases} \\ \underline{\underline{f(n) = \Theta(g(n))}} & \end{aligned}$$

"it's  
true for  
 $n=1$ , just to  
have common  
 $n_0$  we keep  
it  $\underline{\underline{2}}$ .  $\checkmark$

$$\begin{array}{c} 3n \leq 3n+2 \leq 4n. \\ \downarrow c_1 \quad \downarrow c_2 \end{array} \quad \text{For } n_0 \geq 2$$

$$\therefore \frac{3n+2}{f(n)} = \underline{\underline{\Theta(n)}}. \quad \text{For } \begin{cases} c_1 = 3, c_2 = 4 \\ n_0 = 2 \end{cases} \quad \text{and } n \geq n_0 \text{ where } n_0 = 2.$$

$$\Rightarrow \boxed{\underline{\underline{f(n) = \Theta(g(n))}} \text{ for } \begin{cases} c_1 = 3, c_2 = 4 \\ n_0 = 2 \end{cases} \text{ and } n \geq n_0 \text{ where } n_0 = 2}$$

Q) find the time required when Algo takes 0.5 ms for input size = 100  
How long will it take for input size 500 when the complexity is

- (a) linear
- (b) quadratic
- (c)  $n \log n$  [commonly known]
- (d) cubic

Note → Complexity ⇒ Order of growth ⇒ no of steps for input n.

### (a) linear order of growth.

$$\begin{array}{lll} \text{if } n = 100 & \longrightarrow & \text{No of steps} = 100 \\ \text{if } n = 500 & \longrightarrow & \text{No of steps} = 500 \end{array}$$

for  $n = 100$  i.e. 100 steps time  $\Rightarrow 0.5 \text{ ms}$

for  $n = 500$  i.e. 500 steps time  $\Rightarrow x$ .

$$x = \frac{500 \times 0.5}{100} = \underline{\underline{2.5 \text{ ms}}}.$$

### (b) Order of growth = quadratic.

$$\begin{array}{ll} \text{if } n = 100 & \longrightarrow \text{No of steps} = (100)^2 \\ \text{if } n = 500 & \longrightarrow \text{No of steps} = (500)^2 \end{array}$$

for  $n = 100$  i.e.  $(100)^2$  steps  $\rightarrow 0.5 \text{ ms}$

for  $n = 500$  i.e.  $(500)^2$  steps  $\rightarrow x$ .

$$\underline{\underline{x = 12.5 \text{ msec}}}$$

c) Order of growth =  $n \log n$ .

if  $n=100 \rightarrow$  No of steps =  $(100) \log 100$  steps  $\rightarrow 0.5 \text{ ms}$ .

if  $n=500 \rightarrow$  No of steps =  $(500) \log 500$  steps  $\rightarrow x$ .

$$x = \frac{0.5 + 500 \log 500}{100 \log 100} = \underline{\underline{3.3737 \text{ ms}}}$$

d) Order of growth = cubic.

if  $n=100 \rightarrow$  No of steps =  $(100)^3$  steps  $\Rightarrow 0.5 \text{ ms}$

if  $n=500 \rightarrow$  No of steps =  $(500)^3$  steps  $\Rightarrow x$ .

$$\underline{\underline{x = 62.5 \text{ ms}}}.$$

Q Check if  $O$ ,  $\Omega$ ,  $\Theta$  is possible or not.

[ If  $O$  and  $\Omega$  is possible then only  $\Theta$  is possible ]

$$\text{① } f(n) = n+5$$

$$g(n) = n.$$

Check for 'O'.

$$n+5 \leq c \cdot n.$$

Now find  $c$  and no  
to satisfy this

$$\text{let } \underline{\underline{c=2}}$$

$$n+5 \leq 2n$$

for  $n \geq 5$

$$\therefore n+5 \leq 2n \quad \forall n \geq 5$$

$$\underline{\underline{c_1=2}}$$

Big O is possible.

Check for  $\Omega$

$$n+5 \geq c \cdot n$$

Now find  $c$  & no  
to satisfy this

$$\text{let } c=1$$

$$n+5 \geq n.$$

true for  $\forall n \geq 1$

$$\therefore n+5 \geq n \quad \forall n \geq 1$$

$$\underline{\underline{c_2=1}}$$

$\Omega$  is possible

For  $\Theta$

$$\text{we have } n+5 \geq n \quad \forall n \geq 1$$

can be  
written as

$$n+5 \geq n \quad \forall n \geq 5 \quad (\text{I})$$

$$\& \quad n+5 \leq 2n \quad \forall n \geq 5 - \text{II}$$

$\therefore$

$$\boxed{n \leq n+5 \leq 2n \quad \text{true } \forall n \geq 5}$$

$\downarrow c_1=1 \quad \downarrow c_2=2$

$$\therefore \underline{\underline{(n+5)=\Theta(n)}}$$

$\therefore \Theta$  is possible

O chk if O,  $\Omega$ , O is possible.

$$f(n) = n^2 \quad g(n) = n^3$$

let chk for O

$$f(n) \leq c \cdot g(n)$$

$$n^2 \leq c \cdot n^3$$

$$\text{wt } c=1, n_0=1$$

$$n^2 \leq n^3$$

$$\begin{array}{l} \text{for } n_0=1 \\ 1 \leq 1 \quad \checkmark \end{array}$$

$$\begin{array}{l} \text{for } n_0=2 \\ 2^2 \leq 2^3 \quad \checkmark \end{array}$$

$$\therefore \boxed{\begin{array}{l} f(n) = O(g(n)) \text{ if } n \geq n_0 \\ \text{for } c=1 \text{ and } n_0 \geq 1 \end{array}}$$

Big O is possible.

let chk for  $\Omega$

$$f(n) \geq c \cdot g(n)$$

$$n^2 \geq c n^3$$

thus is possible only when  $c = \frac{1}{n}, \frac{1}{n^2}, \dots$

But c has to be constant

$\therefore \Omega$  is not possible

Since  $\Omega$  is not possible, even O is not possible.

(Q) Arrange the following in increasing order.

- (a)  $\underline{n}^{1/3}$  (b)  $e^n$  (c)  $\underline{n}^{7/4}$  (d)  $n(\log n)^9$  (e)  $(1.000001)^n$

Note  $e = \underline{2.71828}$

Sol first we compare  $e^n$  and  $(1.000001)^n$

$$\therefore \boxed{(2.71828)^n > (1.000001)^n}$$

$$\therefore \boxed{e^n > (1.000001)^n}$$

Now consider  $n^{1/3}$  and  $\underline{n}^{7/4}$

$$\boxed{\frac{n^{0.3}}{n} < \frac{n^{1.7}}{n}}$$

Now compare  $n^{1/3}$  and  $n(\log n)^9$

$$\boxed{n^{0.3} < n^1(\log n)^9}$$

for very large value of  $n$

$$\boxed{\frac{n^{0.3}}{n} < n^1(\log n)^9.}$$

$$\therefore \boxed{n^{1/3} < n^1(\log n)^9 < n^{7/4} < (1.000001)^n < e^n}$$

at  $n=100000$   $n(\log n)^9 = (10)^5$

Q) Find the Time Complexity

1

main()

$$x = y + z; \quad \text{1 time}$$

for (i=1 to n)

$x = y + z;$   $\longrightarrow n \text{ time}$

for ( $i=1$  to  $n$ )

$\text{fvr}(\zeta_1^0 = 1 \text{ to } n)$

1  $x = y + z$ ;  $\rightarrow n^2$  time

$$\text{Total} = 1 + n + n^2 = \text{Upper Bound} = \underline{\underline{O(n^2)}}$$

② for( i=1 to n)

stmt  $\longrightarrow$  n time

$$\Rightarrow n + n = 2n$$

for ( i = 1 to n )

stmt  $\longrightarrow$  n time

$$\overline{T}_{\text{Total}} = \underline{\underline{O(n)}}$$

③  $i = 1;$

while ( $i \leq n$ )

$\Rightarrow$  n time

$$d \cdot 9 = 9 + 1;$$

3

if  $i = i \pm k$   $\xrightarrow[\text{execute}]{\text{Imp will}} \underline{\underline{n/k \text{ time}}}$ .

⑤ for ( $i=1$ ;  $i \leq n$ ;  $i = i + 1$ )

1. Chk no of slnts
  2. How many time a statement will execute (order of mag)
  3. Add all order of magnitude -

④  $i=1$   
 $\text{while } (i \leq n) \Rightarrow n/5$  time

$$\begin{array}{l} \textcircled{1} = 1 \\ \textcircled{2} = 5 \\ \textcircled{3} = 10 \\ \textcircled{4} = 15 \end{array}$$

do time

```

 $i = n;$ 
while ( $i >= 1$ )
     $i = i - 5;$ 
}

```

$n/5$   
time.

⑤  $\text{for } (i=1; i \leq n; i = 2 * i)$

stmt.

$$i=1 \Rightarrow 2^0$$

$$i=2^1$$

$$i=4 \Rightarrow 2^2$$

:

at we say loop executes K time

$$\text{At } K^{\text{th}} \text{ iteration } i = 2^K = n$$

$$\text{In last } K^{\text{th}} \text{ iteration} = i = 2^K = n$$

$$K \log 2 = \log n$$

$$K = \log_2 n$$

loop executes K time  $\Rightarrow \boxed{\log_2 n}$  time.

⑥  $\text{for } (i=1; i \leq n; i = i + 3)$

stmt.

$$i=1 \Rightarrow 3^0$$

$$i=3 \Rightarrow 3^1$$

$$i=9 \Rightarrow 3^2$$

let loop executes K time

$$\therefore \text{In last iteration } i = 3^K = n.$$

$$\therefore \boxed{K = \log_3 n}$$

loop executes  $\log_3 n$  time

⑦  $\text{for } (i=n; i \geq 1; i = i/3)$

stmt.

$$i = n/3^0$$

$$i = n/3^1$$

$$i = n/3^2$$

let loop executes K time

$$\therefore \text{In last iteration } i = n/3^K = 1$$

$$\therefore \frac{n}{3^K} = 1$$

$$\therefore n = 3^K$$

$$\therefore n = 3^k$$

$$k = \log_3^n$$

$\therefore$  Loop Exports  $\log_3^n$  time.

\* If  $i = i * k$  or  $i = i / k$  then Loop Exports  $\log_k^n$  time.

④ for( $i=1$ ;  $i <= n$ ;  $i = i^2$ )  
stmt.

$$\begin{aligned} i &= 2^{2^0} \\ i &= 2^{2^1} \\ i &= 2^{2^2} \\ i &= \dots \end{aligned}$$

Let there be  $K$  iterations

$\therefore$  In last iteration

Take log on BS.

$$2^K \log 2 = \log n$$

$$2^K = \log_2^n.$$

Take log on BS.

$$K \log 2 = \log(\log_2^n)$$

$$K = \log_2(\log_2^n)$$

$$i = 2^{2^K} = n$$

for( $i=n$ ;  $i>=1$ ;  $i=i/2$ )  
stmt

$$\begin{aligned} i &= n^{1/2^0} \\ i &= n^{1/2^1} \\ i &= n^{1/2^2} \end{aligned}$$

W  $K$  iterations.

In last iteration

$$i = n^{1/2^K} = 1$$

$$n^{1/2^K} = 1$$

$$\frac{1}{2^K} \log n = \log 1$$

$$\log n =$$

⑤ for( $i=\underline{\underline{2}}$ ;  $i <= n$ ;  $i = i^3$ )

stmt

$\therefore$  Let  $K$  iterations

$$i = 2^{3^0}$$

$$\begin{aligned} i &= 2^{3^1} \\ &\vdots \\ i &= 2^{3^K} \end{aligned}$$

In last iteration

$$i = 2^{3^K} = n$$

$$o_i = \alpha^{3^i}$$

$$o_i = \alpha^{3^{i-1}}$$

$$o_i = \alpha^{3^k} = n$$

$$\therefore 3^k \log \alpha = \log n$$

$$3^k = \log_{\alpha} n$$

$$k = \log_3 (\log_{\alpha} n).$$

If first value  $o_i = a$ , and  $o_i = o_k$

$$\text{loop count} = \left\lceil \log_k (\log_a n) \right\rceil //$$

$a = \text{first value}$

$k = \text{power}$ .

## Recurrence Relation $\rightarrow$

(consider :  $T(n) = 4T(n/2) + \frac{n^2}{2}$ )

$\uparrow$  Time req  
 to solve problem of size  $n$   
 $\uparrow$  Time req to solve problem of size  $n/2$   
 $\uparrow$  cost  
 $\uparrow$  overhead

Time for recursion and merging soln

( $T(n) = T(n/5) + T(4n/5) + n$ )

$\uparrow$  problem of size  $n$   
 $\uparrow$  subproblem of size  $n/5$   
 $\uparrow$  subproblem of size  $4n/5$   
 $\uparrow$  overhead

## Approach $\rightarrow$

Here Problem is divided into Subproblem of smaller size.

Combine soln of subproblems to get the soln of complete Problem

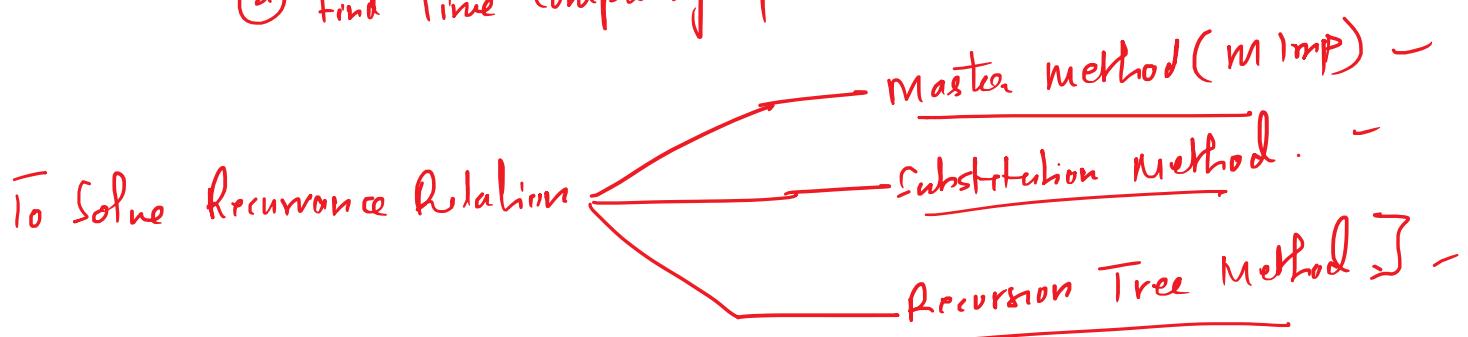

\* Effort is recursively applied on subproblems of different size

Recurrence Relation  $\leftarrow$  Process with But size diff.

Solving Recurrence Relation  $\rightarrow$

① There will be Recurrence Relation given.

② Find Time Complexity of the Recurrence Relation.

## Substitution Method

① Given  $T(n) = \underline{1} \text{ if } \underline{n=1}$   $\longrightarrow$  Terminating condition.  
 $= T(n/2) + n \text{ if } \underline{n \geq 1}$

Using Substitution Method

$$\rightarrow T(\underline{n}) = \underline{T(\underline{n/2}) + n}.$$

$$= \left[ \underline{T(\underline{n/2^1}) + \frac{n}{2}} \right] + n.$$

$$= \left[ \underline{T(\underline{n/2^3}) + \frac{n}{2^2}} \right] + \frac{n}{2^1} + \frac{n}{2^0}$$

At  $k^{\text{th}}$  step  $= T(\underline{n/2^k}) + \frac{n}{2^{k-1}} + \dots + \frac{n}{2^3} + \frac{n}{2^2} + \frac{n}{2} + \frac{n}{2^0}$

At  $k^{\text{th}}$  step problem size  $= 1$

But at  $k^{\text{th}}$  step  $= \frac{n}{2^k}$

$$\therefore \frac{n}{2^k} = 1$$

$$2^k = n$$

$$k = \log_2 n //$$

$$= T(1) + \frac{n}{2^{k-1}} + \dots + \frac{n}{2^1} + \frac{n}{2^0}$$

$$= 1 + n \left( \frac{1}{2^0} + \frac{1}{2^1} + \dots + \frac{1}{2^{k-1}} \right)$$

$$= 1 + n \left( \frac{1}{2^0} + \frac{1}{2^1} + \dots + \frac{1}{2^{\log_2 n - 1}} \right)$$

$$= 1 + n \left( \frac{\overline{a^0} - \overline{a^1}}{\overline{a^0}} \right) d^{\log_2^n}$$

$$\text{G.P.} = \frac{a=1}{r=\frac{1}{2}} \quad n = \log_2^n \rightarrow S_n = \frac{a * (1 - r^n)}{1 - r}$$

Hence  $r < 1$

$$= 1 + n \left( \frac{1 * (1 - 0.5^{\log_2^n - 1})}{\frac{1}{2}} \right)$$

$$= 1 + 2n \left( \frac{1 - 0.5^{\log_2^n - 1}}{\underline{\underline{1}}} \right)$$

$$\asymp 1 + 2n$$

$$\asymp \underline{\underline{O(n)}}.$$

$$\textcircled{1} \quad T(n) = T(n-2) + 1 \quad n > 1$$

$$= 1 \quad \underline{n=1}$$

Solve Using Substitution Method  $\rightarrow$

$$T(n) = T(n-2) + 1$$

$$= T(n-2 \times 1) + 1 + 1$$

$$= T(n-2 \times 3) + 1 + 1 + 1$$

$$T(n) = T(n-2) + 1$$

$$= T(n-2 \times 2) + 1 + 1$$

$$= T(n-2 \times 1) + 1 + 1 + 1$$

$$= T(n-2 \times 3) + 1 + 1 + 1$$

$$\text{At } k^{\text{th}} \text{ step} = T(n-2 \times k) + (1+1+\dots \text{ k time})$$

$$= T(n-2 \times k) + k$$

But here problem size = 1

$$\therefore n-2k=1$$

$$k = \frac{n-1}{2}$$

$$= T(1) + \frac{(n-1)}{2}$$

$$= 1 + \frac{(n-1)}{2} = \frac{2+n-1}{2} = \frac{n+1}{2}$$

$$= \underline{\underline{O(n)}} \quad \underline{\text{linear order}}$$

$$\textcircled{2} \quad T(n) = 2T(n/2) + n \quad n > 1$$

$$= 1 \quad \underline{n=1}$$

$\rightarrow (n + T(n/2) + n)$

$$T(n) = \alpha T\left(\frac{n}{2}\right) + n$$

$\xrightarrow{\quad}$

$$\left( \alpha T\left(\frac{n}{2}\right) + \frac{n}{\alpha} \right)$$

$$\begin{aligned}
 T(n) &= \alpha T\left(\frac{n}{2}\right) + n \\
 &= \alpha \left( \alpha T\left(\frac{n}{2^2}\right) + \frac{n}{\alpha} \right) + \frac{n}{\alpha} \\
 &= \alpha^2 T\left(\frac{n}{2^2}\right) + n + \frac{n}{\alpha} \\
 &= \alpha^3 T\left(\frac{n}{2^3}\right) + \frac{n+n+\frac{n}{\alpha}}{\alpha} \\
 &\vdots \\
 \text{At } k^{\text{th}} \text{ step} \quad T(n) &= \alpha^k T\left(\frac{n}{2^k}\right) + kn.
 \end{aligned}$$

But  $\frac{n}{2^k} = 1$

$$\therefore \boxed{k = \log_2^n}$$

$$\begin{aligned}
 &= \underline{\alpha^{\log_2^n}} T(1) + n * \underline{\log_2^n} \\
 &= n + \underline{n \log_2^n} \\
 &= O(n \log_2^n).
 \end{aligned}$$

$$\begin{aligned}
 n &= 10000 \\
 n &= \underline{100000} + 10000 \times \underline{\log_2^{10000}} \\
 &\quad + \underline{100000} \times \underline{(13.28)}
 \end{aligned}$$

✓

## Recursion Tree Method

Consider

$$T(n) = T(n/c) + T(un/s) + n$$

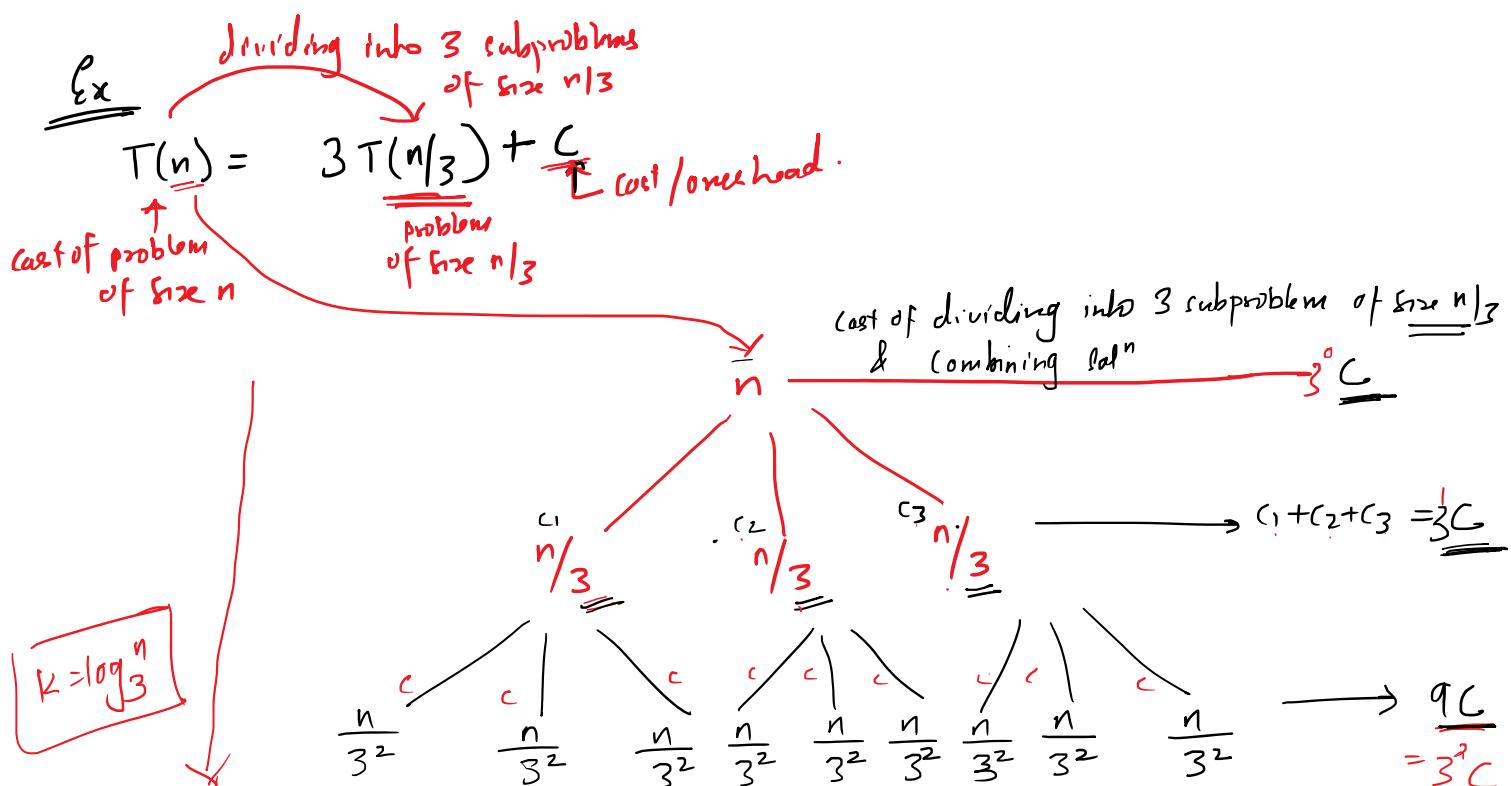

Here in every step we have more than one recursive call.

If Recurrence Relation has more than one Recursive Call then we use Recursion Tree Method.

Steps ① Here draw Recursion Tree from given Relation.

② Cost of each level of Tree needs to be calculated  
(sum of cost of all the nodes at all the level).

③ Total cost of Tree = sum of cost of all the nodes at all the level.

→ let there be  $k$  levels at  $1^{st}$  level problem size = 1  
but at  $k^{th}$  level =  $\frac{n}{3^k}$     ∴  $\frac{n}{3^k} = 1$      $3^k = n$

$$k = \log_3 n$$

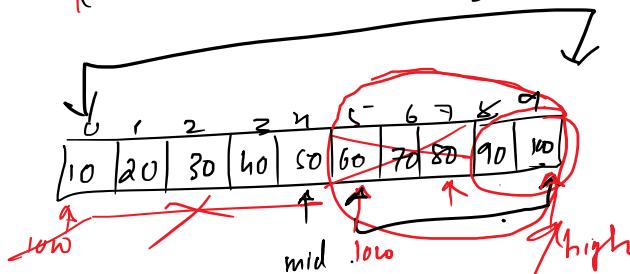

$$T_{\text{Total}} = 3^0 C + 3^1 C + \dots + 3^{\log_3 n} C = C(3^0 + 3^1 + \dots + 3^{\log_3 n})$$

$$\text{Total Cost} = 3^0 C + 3^1 C + \dots + 3^{log_3 n} C = C \left( 3^0 + 3^1 + \dots + 3^{log_3 n} \right)$$

Binary Search

- ① calculate Mid
- ② if  $x < a[mid]$   $\Rightarrow high = mid - 1$
- ③ if  $x > a[mid]$   $\Rightarrow low = mid + 1$

$$T(n) = T\left(\frac{n}{2}\right) + \underbrace{\dots}_{mid \rightarrow \frac{l+h}{2} \Rightarrow \text{constant time}}$$

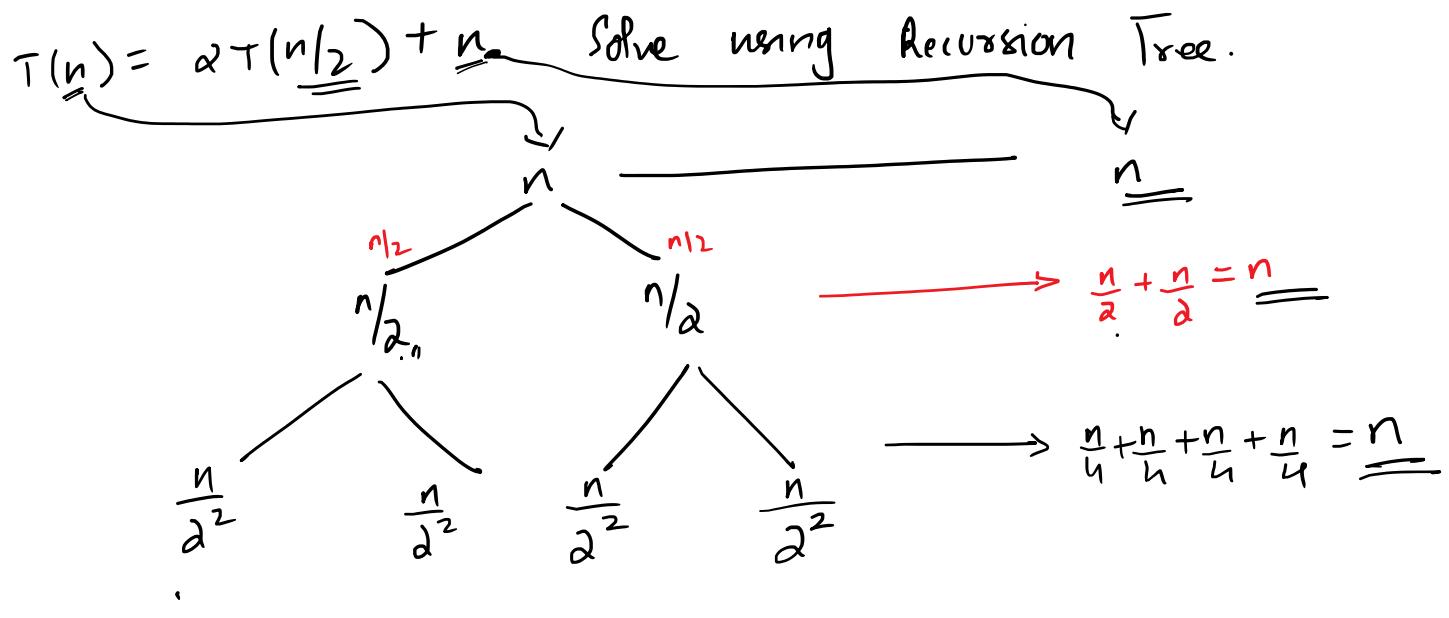

$x = 40$

$$\left. \begin{array}{l} low = 0 \\ high = 9 \\ mid = \frac{0+9}{2} \\ = 4 \end{array} \right\}$$

Is  $x == a[4]$  No

Is  $x < a[4]$  Yes

$$low = mid + 1 = 5$$

At at  $1^{\text{st}}$  level problem  $S_{12c} = 1$

at  $K^{\text{th}}$  level problem  $S_{K2c} = \frac{n}{2^K}$

$$\therefore \frac{n}{2^K} = 1$$

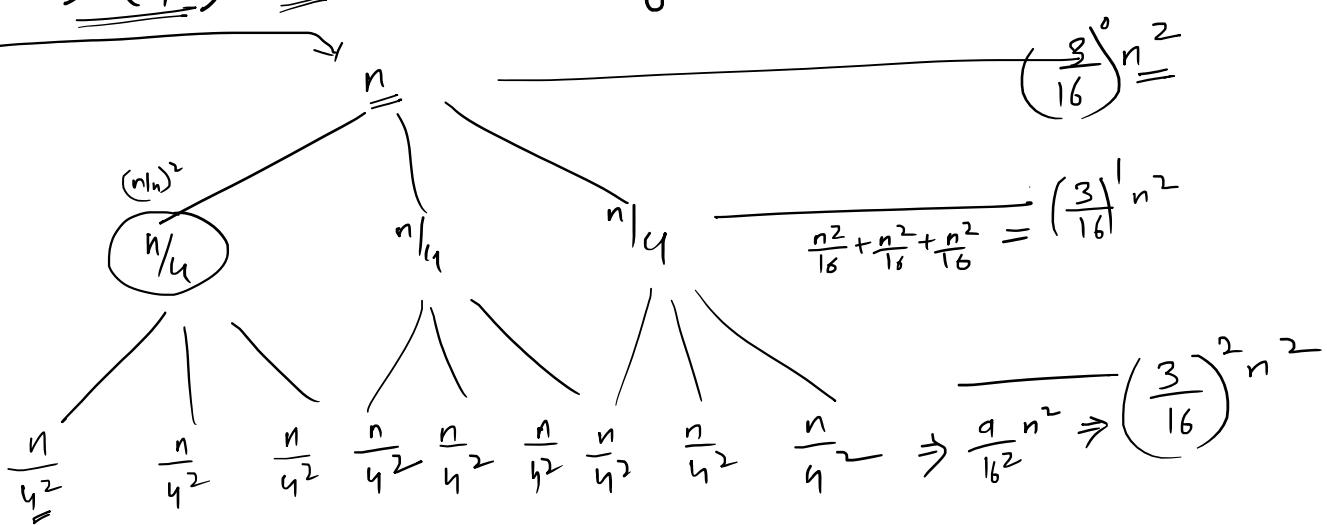

$$K = \log_2^n$$

Cost of every level =  $n$

No of levels =  $K = \log_2^n$

$$\text{Total Cost} = \underline{\underline{n \log_2^n}}$$

$$T(n) = \underbrace{3T(n/4)}_{\text{Solve using recursion tree}} + n^2$$

At  $1^{st}$  level problem size = 1  
At  $k^{th}$  level problem size =  $\frac{n}{4^k}$

$$\frac{n}{4^k} = 1$$

$$\begin{aligned} 4^k &= n \\ k &= \log_4 n \end{aligned}$$

$$\begin{aligned} \text{Total cost} &= n^2 \left( \left(\frac{3}{16}\right)^0 + \left(\frac{3}{16}\right)^1 + \left(\frac{3}{16}\right)^2 + \dots + \left(\frac{3}{16}\right)^k \right) \\ &= n^2 \left( \left(\frac{3}{16}\right)^0 + \left(\frac{3}{16}\right)^1 + \left(\frac{3}{16}\right)^2 + \dots + \left(\frac{3}{16}\right)^{\log_4 n} \right) \\ &= n^2 \left[ \frac{1 - \left(\frac{3}{16}\right)^{\log_4 n}}{1 - \left(\frac{3}{16}\right)} \right] \approx n^2 \end{aligned}$$

$$T(n) = T\left(\frac{n}{3}\right) + T\left(\frac{2n}{3}\right) + n^2$$

$\log \frac{n}{3}$

$\log \frac{n}{3/2}$

$\approx$

$\approx$

① Substitution Method

$$\textcircled{1} \quad T(n) = \begin{cases} 1 & \text{if } n=1 \\ T(n-1) + \lg n & \text{if } n>1 \end{cases}$$

$$\textcircled{2} \quad T(n) = \begin{cases} 1 & \text{if } n=1 \\ 8T(n/2) + n^2 & \text{if } n>1 \end{cases}$$

$$\textcircled{3} \quad T(n) = \begin{cases} 1 & \text{if } n=2 \\ 7T(n/2) + n^2 & \text{if } n>2 \end{cases}$$

Recursive Tree

$$\textcircled{1} \quad T(n) = T(n/5) + T(4n/5) + n$$

$$\textcircled{2} \quad T(n) = T(n/10) + T(9n/10) + n$$

$$\textcircled{3} \quad T(n) = T(n/3) + T(2n/3) + n$$

$$\textcircled{4} \quad T(n) = T(n/2) + T(n/3) + T(n/4) + C$$

..... Next Page

## Master Method

$$\textcircled{1} \quad T(n) = 8T(n/2) + n^2$$

$$\textcircled{2} \quad T(n) = T(n/2) + C$$

$$\textcircled{3} \quad T(n) = 2T(n/2) + n \log n$$

$$\textcircled{4} \quad T(n) = 32T(n/2) + n^3$$

$$\textcircled{5} \quad T(n) = T(\sqrt{n}) + C$$

$$\text{Substitution} \rightarrow T(n) = T(n^{1/2}) + C.$$

$$\boxed{\text{put } n = 2^k}$$

$$T(2^k) = T(2^{k/2}) + C.$$

$$\text{let } T(2^k) = S(k)$$

$$\Rightarrow \boxed{S(k) = S(k/2) + C}$$

$$\curvearrowleft T(n) = aT(n/b) + f(k)$$

$$a=1, \quad b=2, \quad f(k)=C.$$

$$\log_b^a = \log_2^1 = n^0 = \underline{\underline{C}}$$

$$\boxed{n^{\log_b^a} = f(n)} = O(k^{\log_b^a} \log k)$$

$$\boxed{n^{\log b} = f(n)} = O(k^{\log b} \log k)$$

$$= \underline{O(k^0 \log k)}$$

$$= \underline{O(\log k)}$$

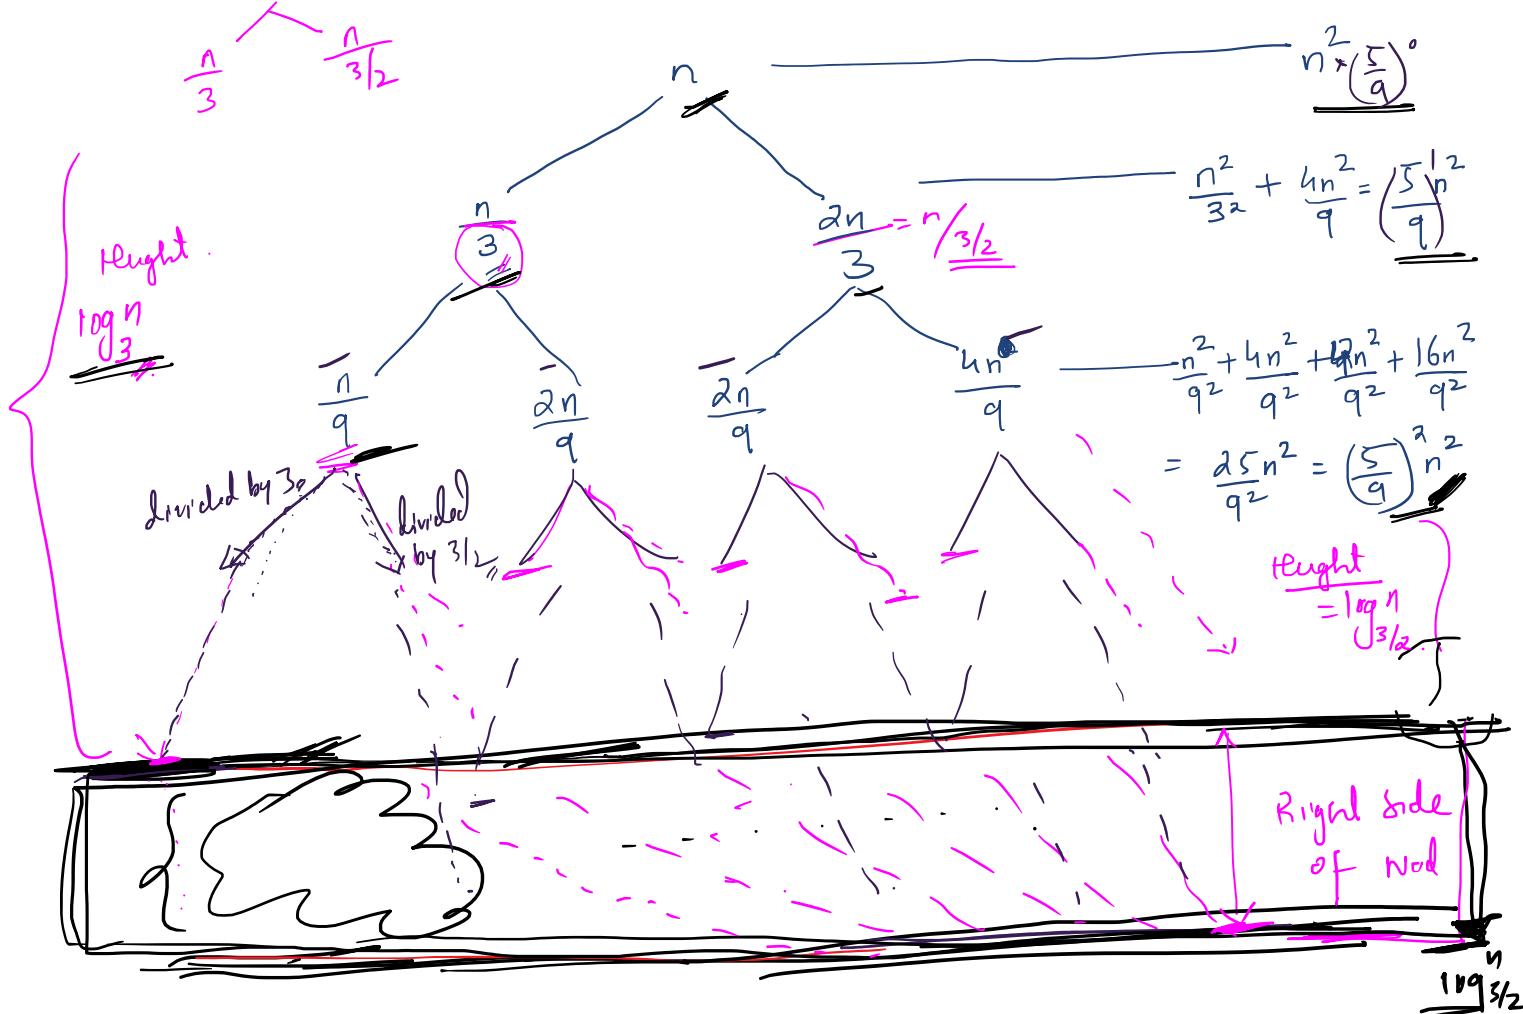

But  $n = a^k$

$$\therefore \boxed{k = \log_a^n}$$

$$= \underline{O(\log \log_2^n)}$$

Recursion Tree

$$T(n) = T\left(\frac{n}{3}\right) + T\left(\frac{2n}{3}\right) + n^2$$

Consider left side  $\Rightarrow$  The height of left side  $= \log_3 n$

$$\begin{aligned}
 \text{Cost on left side} &= \left(\frac{5}{9}\right)^0 n^2 + \left(\frac{5}{9}\right)^1 n^2 + \left(\frac{5}{9}\right)^2 n^2 + \dots + \left(\frac{5}{9}\right)^{\log_3 n} n^2 \\
 &= n^2 \left[ \left(\frac{5}{9}\right)^0 + \left(\frac{5}{9}\right)^1 + \left(\frac{5}{9}\right)^2 + \dots + \left(\frac{5}{9}\right)^{\log_3 n} \right] \\
 &= n^2 \left[ \frac{1 - \left(\frac{5}{9}\right)^{\log_3 n + 1}}{1 - \frac{5}{9}} \right] = \frac{9n^2}{4} \left( 1 - \left(\frac{5}{9}\right)^{\log_3 n + 1} \right)
 \end{aligned}$$

$$\frac{1 - \left(\frac{5}{9}\right)^{\log_3 n + 1}}{1 - \frac{5}{9}}$$

$$= \underline{(n^2)}$$

here the cost is calculated for the height =  $\log_3^n$  only.  
Right side is not considered.

So this cost < Actual Total Cost

$$n^2 < T(n)$$

$$T(n) = \underline{\Omega}(n^2)$$

$$\underline{f(n)} \geq \underline{c \cdot g(n)}$$

$$f(n) = \underline{\Omega}(g(n))$$

The lower side height gives Lower Bound (Best Case)

Right Side  $\rightarrow$  The max height =  $\log_{3/2}^n$ .

$$\begin{aligned} \text{Total cost} &= \left(\frac{5}{9}\right)^0 n + \left(\frac{5}{9}\right)^1 n^2 + \left(\frac{5}{9}\right)^2 n^2 + \dots + \left(\frac{5}{9}\right)^{\log_{3/2}^n - 1} n^2 \\ &= n^2 \left[ \frac{1 - \left(\frac{5}{9}\right)^{\log_{3/2}^n + 1}}{1 - \left(\frac{5}{9}\right)} \right] = \frac{9n^2}{4} \left( 1 - \left(\frac{5}{9}\right)^{\log_{3/2}^n + 1} \right). \\ &= \underline{n^2} \end{aligned}$$

here we have considered the height till  $\log_{3/2}^n$   
But there Missing nodes in left side that stopped at  $\log_3^n$

Actual Total Cost < calculated Cost Considering Right Side

$$T(n) < n^2$$

$$T(n) = \underline{\Omega}(n^2)$$

Note

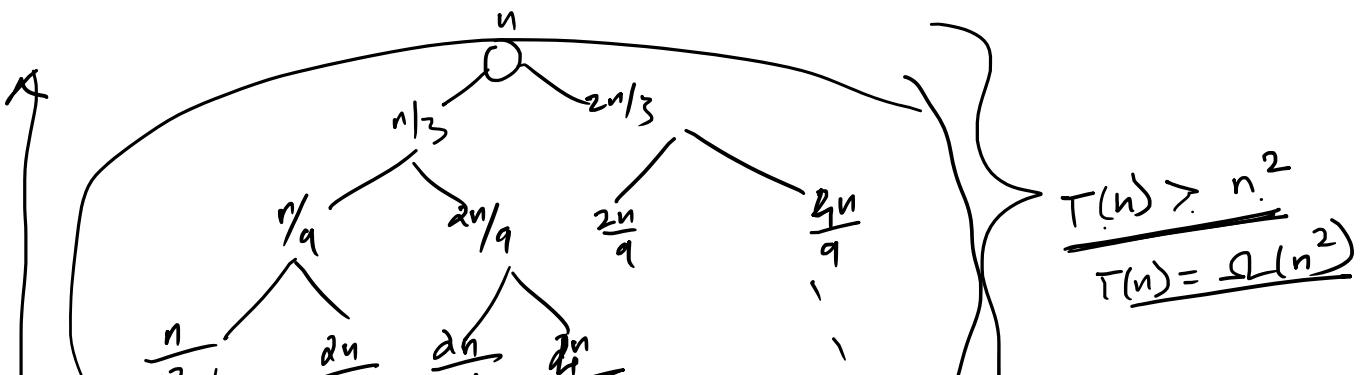

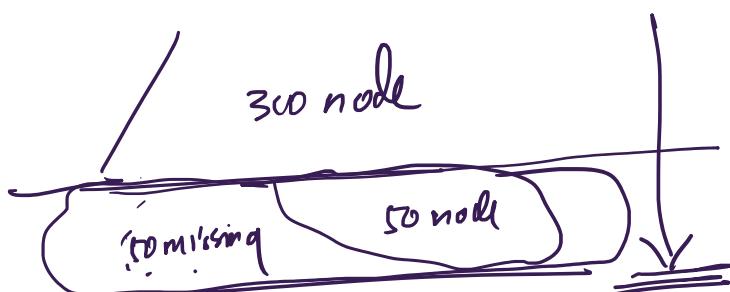

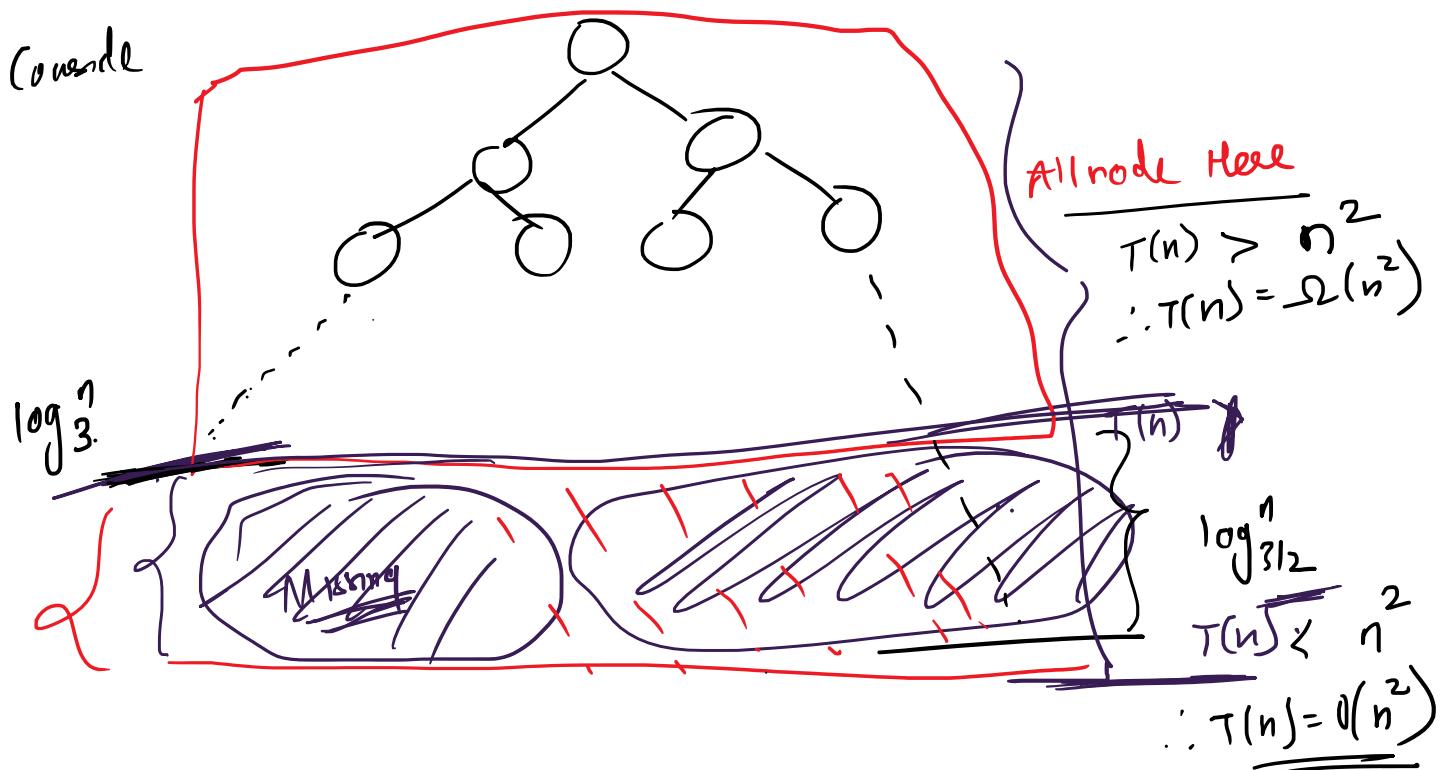

$$\begin{cases} f(n) = O(g(n)) \\ f(r) \leq g(r). \end{cases}$$

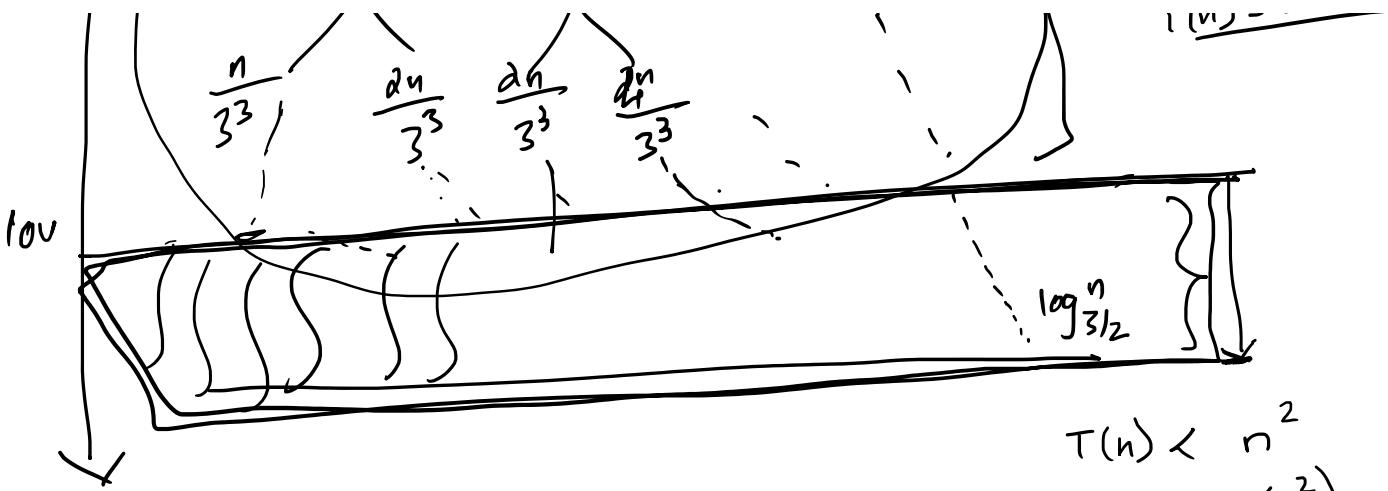

Right Side (Side with more Height) gives Upper Bound

Right side (side with more height) gives Upper Bound

$$T(n) = \Omega(n^2)$$

$$T(n) = O(n^2) \quad \therefore T(n) = \underline{\Omega}(n^2)$$

$$T(n) < n^2$$

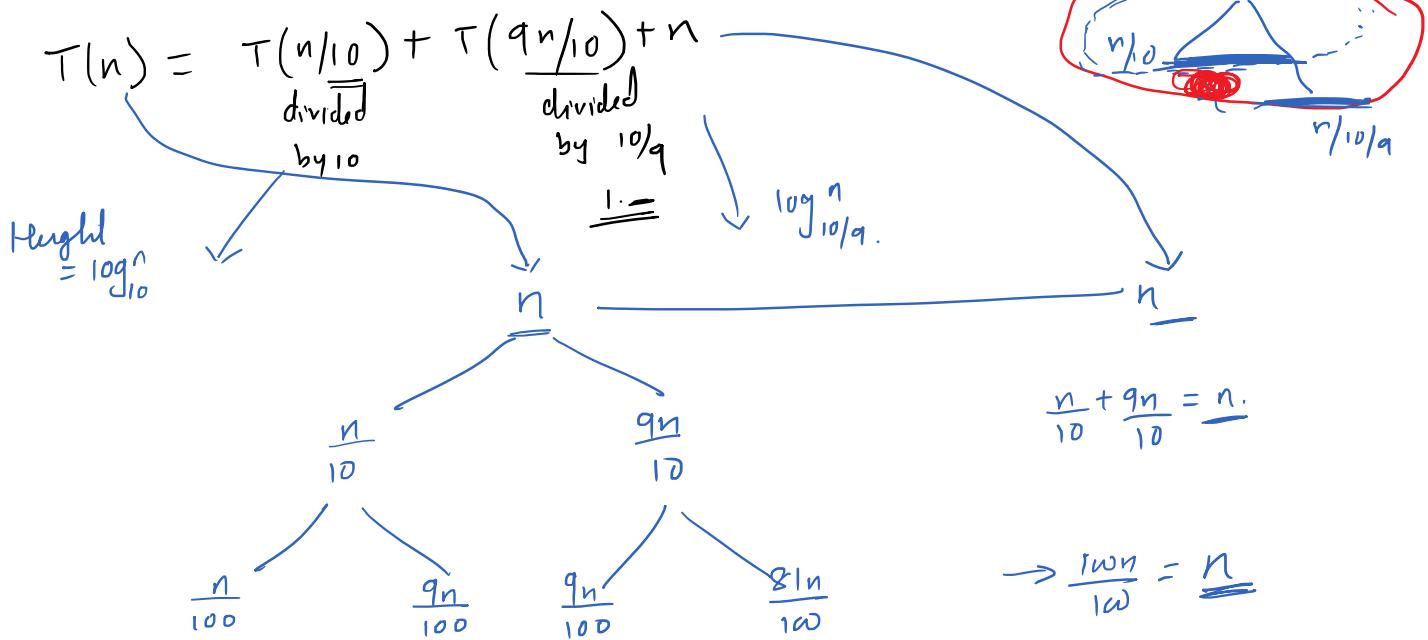

$$\underline{T(n) = O(n^2)}$$

Quicksort

$$T(n) = \alpha T(n/2) + \underline{n} \text{ partition}$$

$$\text{Binary Search. } T(n) = T(n/2) + \frac{1}{4} \underline{\text{mid}} \underline{\text{overhead}}$$

Consider left side  $\Rightarrow$  Height  $= \log_{10}^n$   
Cost of each level  $= n$

$$\begin{aligned} T(\underline{n}) &> \underline{n \log_{10}^n} \\ T(n) &= \underline{\Omega(n \log_{10}^n)} \\ &= \underline{\Omega(n \log n)} \end{aligned}$$

Consider Right side  $=$  Height  $= \log_{10/9}^n$

Cost of each level  $= n$ .

Compound Cost  $= \underline{n \log_{10/9}^n}$

$T(n) < \underline{n \log_{10/9}^n}$

$$\begin{aligned} \therefore T(n) &= \underline{O(n \log_{10/9}^n)} \\ &= T(n) = O(n \log n) \end{aligned}$$

$\therefore \boxed{T(n) = \underline{O(n \log n)}}$

③ Master Method → if it is cook book method to determine Time Complexity of Recurrence relation of form

$$\boxed{T(n) = \underbrace{aT(n/b)}_{\downarrow} + f(n)}$$

Here  
a and b are +ve constants

$$\underline{a \geq 1} \quad \underline{b > 1}$$

$$f(n) = \text{is } +\text{ve } f^n.$$

•  $T(n)$  can be bounded asymptotically as follows →

(case 1) If  $f(n) = O(n^{\log_b^a - \epsilon})$  where  $\epsilon > 0$   
then  $T(n) = O(n^{\log_b^a})$

case 1  
 $f(n) < n^{\log_b^a}$   
then  $T(n) = O(n^{\log_b^a})$

(case 2) If  $f(n) = O(n^{\log_b^a})$  then

$$T(n) = \underline{O(n^{\log_b^a} \log n)}.$$

case 2  
 $n^{\log_b^a} = f(n)$   
 $T(n) = O(\cancel{n^{\log_b^a}} \log n)$

(case 3) If  $f(n) = \Omega(n^{\log_b^a + \epsilon})$   $\epsilon$  is +ve constant

and if  $a f(n/b) \leq c \cdot f(n)$  for  $c < 1$

$$\text{then } T(n) = O(f(n)).$$

case 3  
If  $n^{\log_b^a} < f(n)$

then we have to prove for  $c < 1$   $a f(n/b) \leq c \cdot f(n)$

If proved then  $T(n) = O(f(n))$ .

$$\underline{\text{Steps}}. \quad \text{if } n^{\log_b^a} > f(n) \longrightarrow O(n^{\log_b^a})$$

$$\text{if } n^{\log_b^a} = f(n) \longrightarrow O(n^{\log_b^a} \log n).$$

$$\text{if } n^{\log_b^a} < f(n) \xrightarrow{\text{if proved}} O(f(n)).$$

$$af(n/b) \leq c \cdot f(n)$$

$$\text{for } c < 1$$

### Trick

① Identify  $a, b, f(n)$  from given relation

② Calculate  $n^{\log_b^a}$

③ Compare  $\underline{n^{\log_b^a}}$  with  $\underline{f(n)}$

Whoever is greater by Polynomial time, it is the answer.

(4) Agar Same Hai then

$n^{\log_b^a} \log n$

(5) If one side is not greater by polynomial time then make both side same.

then apply this

$$T(n) = aT(n/b) + f(n)$$

①  $T(n) = \underbrace{8T(n/2)}_{a} + \underbrace{n^2}_{f(n)}$

$$a=8, b=2, f(n)=\underline{\underline{n^2}}$$

$$\textcircled{1} \quad \underline{\underline{n^{\log_2 8}}} \Rightarrow n^{\log_2 8} \Rightarrow n^3$$

Compare with  $f(n) = n^2$

✓  $\underline{\underline{n^{\log_2 8}}} > f(n)$   
(one is satisfied)  $\rightarrow T(n) = O(\underline{\underline{n^{\log_2 8}}}) = \underline{\underline{O(n^3)}}$

$$\textcircled{2} \quad T(n) = 1 \cdot T(n/2) + c$$

$\uparrow$   
constant (any constant value)

$$\underline{\underline{a=1}}, \underline{\underline{b=2}}, \underline{\underline{f(n)=c}}$$

$$\therefore \underline{\underline{n^{\log_2 1}}} = \underline{\underline{n^0}} \Rightarrow n^0 = \underline{\underline{1 = \text{constant}}}$$

$$\therefore \underline{\underline{n^{\log_2 1}}} = f(n) \quad (\text{condition 2 satisfied}) =$$

$$T(n) = O(\underline{\underline{n^{\log_2 1} \log n}})$$

$$= O(\underline{\underline{c \cdot \log_2 n}}) = \underline{\underline{O(\log n)}}$$

## Bubble Sort →

```
#include<stdio.h>
#include<stdlib.h>
#include<time.h>
void bubblesort(int x[], int n)
{
    int i, j, t;
    for(i=0; i<n-1; i++)
    {
        for(j=0; j<n-1; j++)
        {
            if(x[j]>x[j+1])
            {
                t=x[j];
                x[j]=x[j+1];
                x[j+1]=t;
            }
        }
    }
}
```

```
int main()
{
    int *inp, i, j;
    FILE *input, *output; } file pointers
    float total;
    clock_t start, end; } variables of type clock_t.
```

```
printf("Bubble sort\n");
    → write mode
    input = fopen("input.txt", "w");
    output = fopen("output.txt", "w"); → write mode
```

```
for(i=5000; i<=25000; i=i+5000)
{
    inp = (int*)(malloc(i*sizeof(int)));
    → write into file
```

```
printf("\nFor n = %d\n", i);
// write i numbers of random values from 0 to i in input file
```

```
for(j=0; j<i; j++)
{
    fprintf(input, "%d", rand()%i);
    → read individual value
    → place the stored value in array.
```

```
fclose(input); → closed input.txt
```

```
input = fopen("input.txt", "r"); → open in read mode.
// read the i numbers of random values and store them in array of int
for(j=0; j<i; j++)
{
    fscanf(input, "%d", &inp[j]);
    → read from file
```

## File Handling

→ To access file we need FILE pointer

→ open file : FILE \* input, \* output

input = fopen("filename", "mode")  
 will open file in given mode  
 and will return the add of file

mode → r = will open file read mode  
 w = " " " " write mode  
 (override)  
 a = → append mode

## To read from file →

```
fscanf("pointername", "%d", "array add")
    ↑
    kahan se   "read"
    kya type   "read Kalna"
    read Kalna
    hai
    kahan store
    Kalna
    hai
```

## To write into File

```
printf("%d", a[i])
    ↑
    pointer name
    write into this file
    "Kahan k"
    kya value
```

```

    tscant(input,"%d",&inp[i]);
} ↳ read from file
start=clock(); → start counting time.
bubblesort(inp,i); → call bubblesort fn
end=clock(); → stop counting time
total=(float)(end-start)/CLOCKS_PER_SEC; → Total seconds
for(j=0;j<i;j++)
{
    fprintf(output,"%d ",inp[j]); } write content of inp array in the output.txt file.
}
printf("Total Time : %f\n\n",total);
}
fclose(input);
fclose(output);
return 0;
}

```

$(float)(end - start) \Rightarrow \frac{\text{No of clocks spent}}{\text{CLOCKS\_PER\_SEC}}$  (CPU clock cycle)

$\text{No of Sec} = \frac{\text{No of clocks spent}}{\text{CLOCKS\_PER\_SEC}}$  constant (predefined in <time.h>)

\* will vary from system to system.

## Selection Sort →

```
void selectionsort(int a[], int n)
```

{ let min → smallest element  
 $p \Rightarrow$  posn of smallest element}

```
int i, j, t, min, p;  

for(i=0; i<n-1; i++)
```

```
{  

    min=a[i];  

    p=i;
```

will give  
min value  
and its  
posn  
from  
*i+1* to *n*

```
for(j=i+1; j<n; j++)  

{  

    if(a[j]<min)  

    {  

        min=a[j];  

        p=j;  

    }
}
```

t=a[p];  
a[p]=a[i];  
a[i]=t;

Swapping  $a[p]$   
 $a[i]$

$$= \Theta(n^{\log_2^2 \log(\log n)})$$

$$= \Theta(n \log(\log n))$$

## Divide & Conquer →

Approach →

- ① Divide the original problem into subproblems.

- ② Conquer Recursively

i.e. Recursively solve each subproblem.

- ③ Combine the solution of Subproblem to get the solution of main/original problem.

DAC (a, i, j)

d  
if (small (i, j)) } if problem size is very small then return solution small (i, j) return desire

Recursive  
 $T(n) = 2T(n/2) + 1$

dee  
 $mid = (i+j)/2$  Divide  
 $O(1)$

Here assumed center as partition point.

subproblems {  $b = DAC(a, i, mid);$  } Recursively solving  
 $c = DAC(a, mid+1, j);$  } subproblems & getting their Solution

$d = \text{combine}(b, c);$  } combining sol'n of subproblem  
 ↴ return  $d'$

?

\* Best Case Recurrence Rel<sup>n</sup> for Quicksort

Assume the partition f<sup>n</sup> divides array into 2 halves.

$$T(n) = \frac{2 T(n/2)}{\text{Recursion call}} + n \quad \uparrow \text{partition f}^n \text{ cost.}$$

$$a=2, b=2, k=1, p=0$$

$$a=2 \\ b^k \Rightarrow 2^1 = 2$$

$$\underline{a=b^k} \quad \text{case 2}$$

$$\text{chk } p=0 > -1 \Rightarrow T(n) = \Theta\left(\frac{\log^a n}{n} (\log n)^{p+1}\right) \\ = \Theta\left(\frac{\log^2 n}{n} (\log n)^{0+1}\right) \\ = \underline{\Theta(n \log n)}.$$

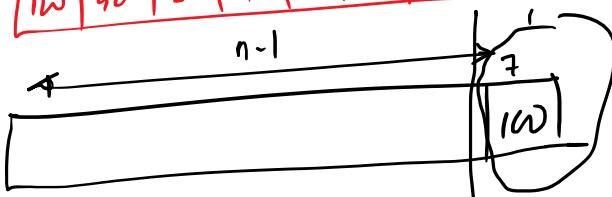

Worst Case for Quicksort

If input array is sorted (AS/BS)

Ascending

10	20	30	40	50	60	70	80	90
0	1	2	3	4	5	6	7	8
$i = 0$	$j = 8$							
$x = a[0]$								

10	20	30	40	50	60	70
100	90	80	70	60	50	40

After 1<sup>st</sup> iteration array is divided into size  $\frac{n}{2}$  &  $\frac{n-1}{2}$

$$\therefore \text{Recurrence Rel}^n = T(n) = T(n-1) + \frac{n}{2} \quad \text{Time for partition}$$

$$\therefore \text{Recurrence Reln} = T(\underline{n}) = \underline{T(n-1)} + \underline{\underline{n}} \quad \xrightarrow{\text{Time for partition}}$$

for Input  
Sort k

Substitution

$$= [T(n-2) + (n-1)] + n.$$

$$= T(n-3) + (n-2) + (n-1) + n.$$

$$= \frac{T(n-k)}{1} + \frac{(n-(k-1))}{1} + \dots + n.$$

$$n=k=1$$

$$\underline{\underline{n=1+k}}$$

$$\underline{\underline{k=n-1}}$$

$$= 1 + (n - (k-1)) + (n - (k-2)) + \dots + n$$

$$= 1 + (n - (n-1-1)) + (n - (n-1-2)) + \dots + n$$

$$= 1 + \underline{\underline{2+3+\dots+n}}.$$

$$= \frac{n(n+1)}{2} = \underline{\underline{O(n^2)}}$$

To QuickSort

If Input is Sorted Order  $\xrightarrow[\text{case}]{\text{worst}} O(n^2) \Rightarrow \underline{\underline{O(n^2)}}$

If Input is Randomly array  $\xrightarrow[\text{case}]{\text{Best}} \underline{\underline{O(n \log n)}} = \underline{\underline{\Omega(n \log n)}}$

## Recursive Binary Search →

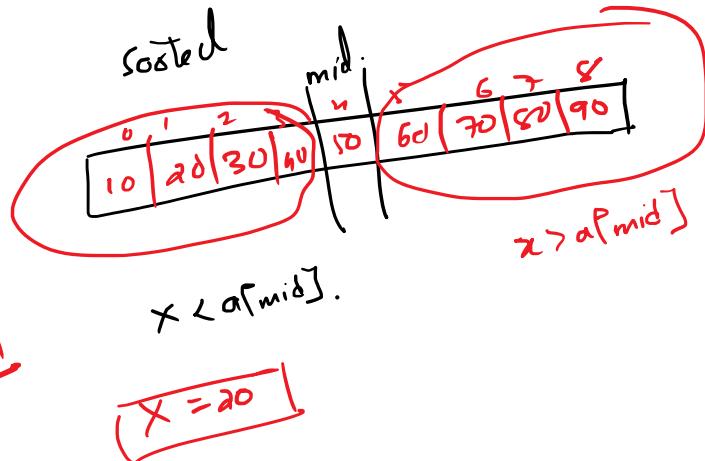

```
#include<stdio.h>
int binarysearch(int a[], int low, int high, int x)
{
    int mid;
    if(low <= high)
    {
        mid = (low+high)/2;
        O(1)
        if(x == a[mid])
            return 1;
        if(x < a[mid])
            ↗ In Non Falsy
            ↗ high = mid + 1
            ↗ x = 20
            ↗ return [binarysearch(a, low, mid-1, x);]
        else
            ↗ high
            ↗ low = mid + 1
            ↗ return [binarysearch(a, mid+1, high, x);]
    }
    return 0;
}

&= \underline{O(\log n)}.
\end{aligned}$$

Merge Sort →

Working Principle

Recursively divide array into sub-size 1 sub-data

## Mergesort →

```
#include<stdio.h>
```

```
void mergesort(int a[], int low, int high)
```

```
{
```

```
int mid;
```

if(low < high) → if array size is not one

```
{
```

mid = (low + high) / 2; → calculate Mid.

✓ mergesort(a, low, mid); } Recursive Call

✓ mergesort(a, mid+1, high);

{ simplemerge(a, low, mid, high); → combine sol of sub

problem.

}

}

```
void simplemerge(int a[], int low, int mid, int high)
```

```
{
```

int temp[50], i, j, k;

i = low;

j = mid+1; // start of second portion

k = 0;

first part      second part  
End Nahi ho janta      End Nahi ho janta.

→ while(i <= mid && j <= high) → if false then at least one part is terminated.

```
{
```

if(a[i] < a[j])

```
{
```

temp[k++] = a[i++];

```
}
```

else

temp[k++] = a[j++];

}

// Now chk which part is finished.

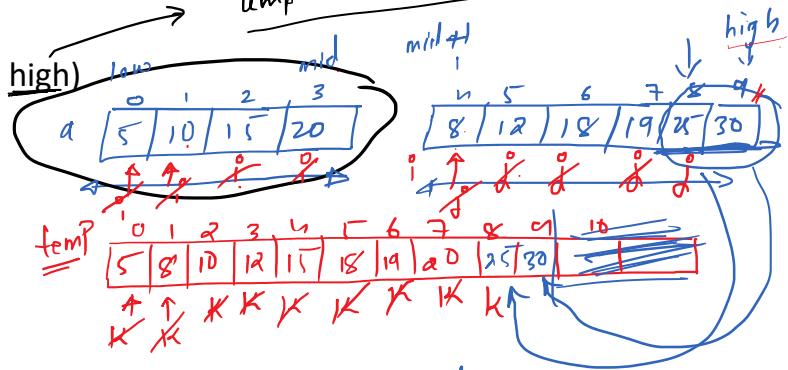

→ while(i <= mid) // jab tak first portion khatam nahi hota

temp[k++] = a[i++];

→ while(j <= high) // jab tak second portion khatam nahi hota

temp[k++] = a[j++];

int \*temp;  
temp = (int \*) malloc (size of (int) \* (high+1));

→ O(n)

will execute  
if second part is finished.  
→ O(n)

will execute if  
first part is finished  
→ O(n)

// copy back from temp to array a

k = 0;

for(i = low; i <= high; i++)

a[i] = temp[k++];

}

$$\Rightarrow n + n + n + n = 4n = O(n)$$

```

int main()
{
    int a[20], n, i;
    printf(" enter nos of elements in array\n");
    scanf("%d", &n);
    a = (int*) malloc(sizeof(int)*n);

    printf("enter elements in array\n");
    for(i=0; i<n; i++)
        scanf("%d", &a[i]);

    printf(" original order of elements\n");
    for(i=0; i<n; i++)
        printf("%d ", a[i]);

    printf("\n");
    mergesort(a, 0, n-1);

    printf(" sorted order of elements\n");
    for(i=0; i<n; i++)
        printf("%d ", a[i]);

    return 0;
}

```

$\leftarrow \underline{\text{sm}} (\underline{a_1}, \underline{a_2}, \underline{a_3}, \underline{a_4})$

$$\text{low} = 0, \text{high} = 11, k = 0$$

for ( $i = \underline{\text{low}}$ ;  $i \leq \underline{\text{high}}$ ;  $i++$ )

$a[i] = \underline{\text{temp}}[\underline{k+i}]$ ;

## Analysis of MergeSort

Recurrence Relation for MergeSort can be written as.

$$T(n) = \underline{\alpha T(n/2)} + O(n) + \underline{O(1)}$$

$$T(n) = \underline{\alpha T(n/2)} + O(n)$$

$$\alpha = 2, \quad b = 2, \quad k = 1, \quad p = 0$$

$$\begin{aligned} \alpha &= 2 \\ b^k &= 2^1 = 2 \quad \underline{\alpha = b^k} \end{aligned}$$

cond<sup>2</sup> so chk p.

$$p = 0 > -1 \quad T(n) = \Theta\left(\frac{\log n}{n} (\log n)^{p+1}\right)$$

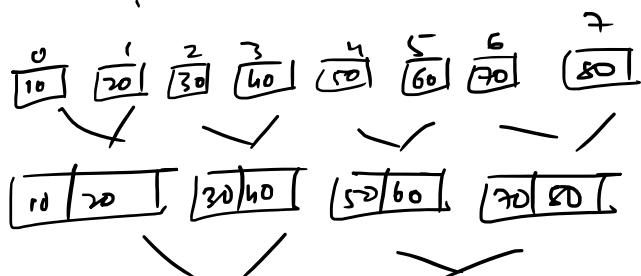

$$= \Theta\left(\frac{\log^2 n}{n} \log n\right)$$

$$T(n) = \underline{\Theta(n \log n)}$$

For MergeSort

$$\left. \begin{array}{l} \text{Best Case} \xrightarrow{\quad} \mathcal{O}(n \log n) \\ \text{Worst Case} \xrightarrow{\quad} \mathcal{O}(n \log n) \\ \text{Avg Case} \xrightarrow{\quad} \mathcal{O}(n \log n) \end{array} \right\}$$

## Module 3 $\rightarrow$ Greedy Algorithm $\rightarrow$

- \* Greedy Algorithm solves problem which has  $n$  inputs and requires us to obtain subsets of solution that satisfies the constraints, is called feasible solution.
- \* We need to find feasible solution that either maximizes or minimizes the objective fn
- \* The greedy algorithm works in states such that only one input is considered at a time.
- \* The decision will be made at each stage whether the particular input is optimal or not.
- \* If input results into infeasible solution cycle then the input is dropped.

### General Algorithm

greedy ( $a, n$ )

{      $\{a[1 \dots n]\}$  possible inputs  
     solution =  $\emptyset$  [Initially empty solution set]

    for ( $i=1$  to  $n$ )  
          $x = \text{select } (a[i])$

```

 $\alpha$        $x = \underline{\text{select}}(a[i])$   

    if ( $\underline{\text{feasible}}(\underline{\text{solution}}(x))$ ) then  

         $\underline{\text{solution}} = \underline{\text{Union}}(\underline{\text{solution}}, x)$  ;
    }
}

```

return solution

}

- Note:
1. we will be given set of n inputs and initially empty solution set
  2. Consider one input at a time.  
Chk if it makes solution feasible.  
If Yes: Add input to the solution set.  
If No: Consider the next input and repeat step 2.
  3. return solution.

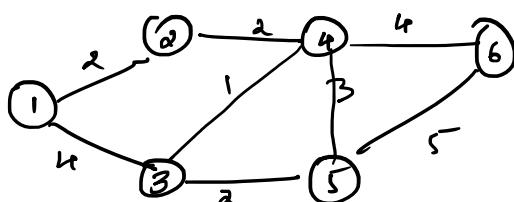

## Problems Solved using Greedy Approach.

### ① Minimum Cost Spanning Tree -

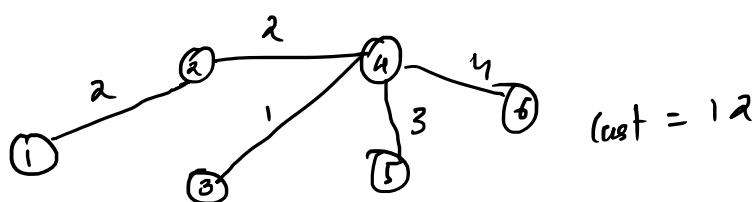

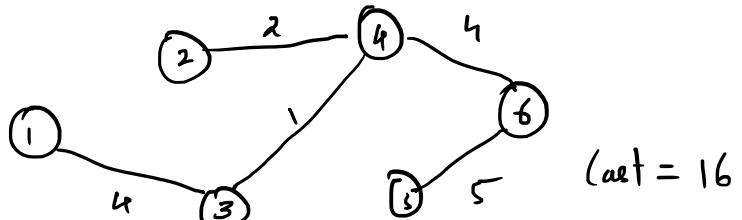

Spanning Tree  $\rightarrow$  It is subgraph of given graph that contains

- (i) All the vertices of original graph and connected.
- (ii) may not contain all the edges.
- (iii) Must not have cycle.

Consider

Possible Spanning Tree:

Many Possible Spanning Tree for given graph  $\rightarrow$

We want to find Spanning Tree of Minimum Cost.  
Known as MST (Minimum Cost Spanning Tree).

- \* It is used Network Design
- \* To find Minimum Cost Spanning Tree
  - Kruskals Algo to find mCST.
  - Prim's Algo to find mCST.

\* A graph can have more than one mCST.

## Kraskals Algo to find mcsf →.

- \* The algorithm uses set of edges sorted in increasing order of weight/cost
- \* The algo starts with empty Spanning Tree
- \* Each edge is taken from set of increasing order of weight and added in the tree.
- \* An edge is discarded if it creates cycle.

Algo → Given a weighted undirected graph of 'v' vertices and 'e' edges let X be the set of edges.  
Sorted in increasing order of weight:

let 'g' be graph and 'T' represent Spanning Tree  
(initially empty).

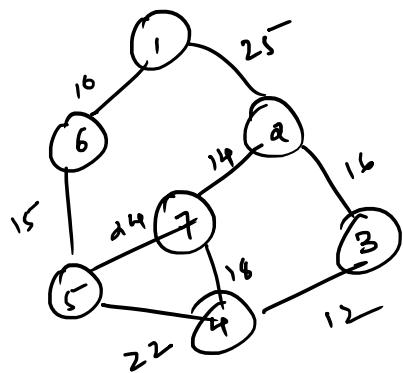

Kruskals(g, T)

do while (no of edges in  $T_0 = v - 1$ ) .

{ let  $w$  = next edge from set X  
add( $w$ ) in Tree 'T' . }

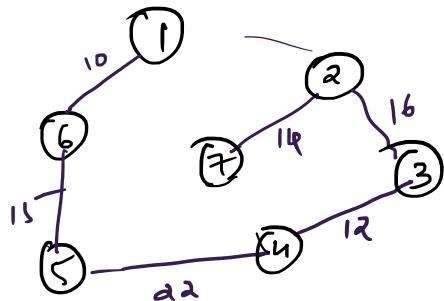

if ( $w$  forms cycle in  $T$ )  
    remove  $w$  from  $T$ .  
}

}

Consider graph.Find mst using Kruskals Algo  $\rightarrow$ 

Step 1) Arrange the edges in increasing order of cost/weight

$$X = \left\{ \frac{1-6}{10}, \frac{4-3}{12}, \frac{2-7}{14}, \frac{5-6}{15}, \frac{2-3}{16}, \frac{4-7}{18}, \frac{5-4}{22}, \frac{5-7}{24}, \frac{1-2}{25} \right\}$$

Step 2(1) Consider edge  $\frac{1-6}{10}$ 

It is not making cycle  
so it is feasible  
add it to  $Sol^n$  set

(2) Consider  $\frac{4-3}{12}$ 

Not making cycle  
so feasible  
 $\therefore$  add to  $Sol^n$  set

(3) Consider edge  $\frac{2-7}{14}$ 

Not making cycle  
so feasible  
add to  $Sol^n$  set

(4) Consider edge  $\frac{5-6}{15}$ 

Not making cycle  
so feasible  
add to  $Sol^n$  set

(5) Consider edge  $\frac{2-3}{16}$ 

Not making cycle  
so feasible  
add to  $Sol^n$  set

(6) Consider edge  $\frac{4-7}{18}$ 

It forms cycle  
reject it

(7) Consider edge  $\frac{5-4}{22}$ 

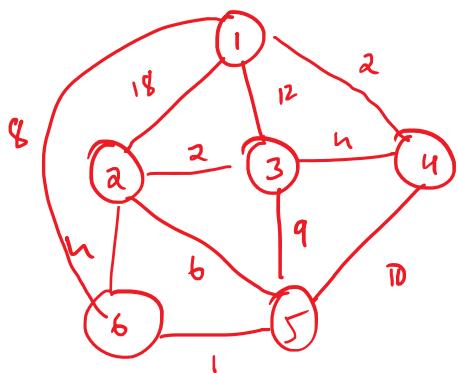

It not forming  
cycle  
feasible  
add to  $Sol^n$  set.

(8) Since No of edges =  $v - 1$   
(6)

$\therefore$  we will stop here  
as all the edge further  
will form cycle  
so reject it.

Q2) Find MST Using Kruskal's Algo

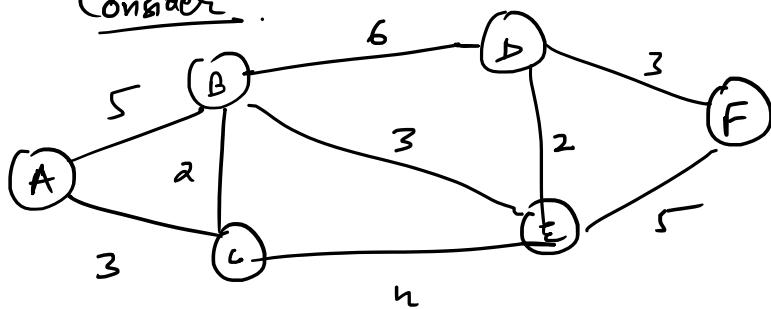

HW

Kruskals Algorithm to find MCST  $\rightarrow$  Here the Algo is based on Vertex

Method 1

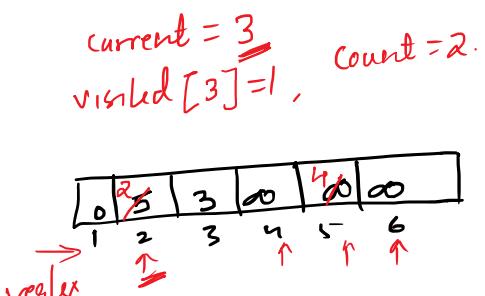

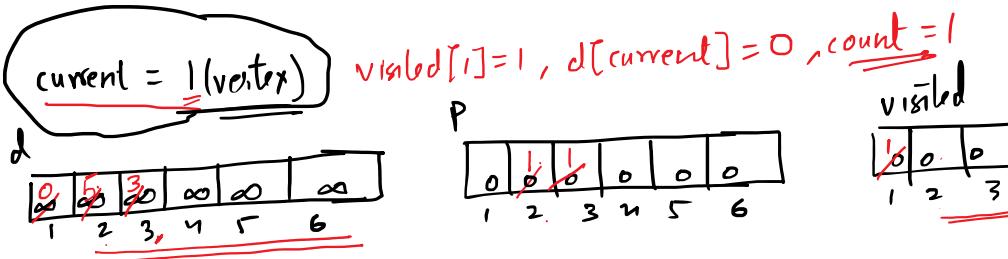

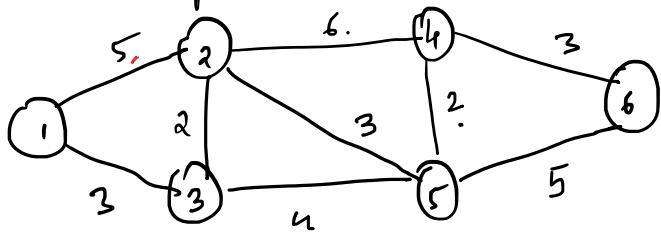

Consider .

Using Prime Algo we find MCST as follows!  $\rightarrow$  -

Vertex Selected	Edge Considered	Edge Selected	Cost	Spanning Tree.
A	$\frac{AB}{5}, \frac{AC}{3}$	AC	3	(A) $\xrightarrow{3}$ C
<u>A, C</u>	$\frac{AB}{5}, \frac{CB}{2}, \frac{CE}{4}$	CB	2	(A) $\xrightarrow{3}$ C $\xrightarrow{2}$ B
<u>A, B, C</u>	$\frac{BD}{6}, \frac{BE}{3}, \frac{CE}{4}$	BE	3	(A) $\xrightarrow{3}$ C $\xrightarrow{2}$ B $\xrightarrow{3}$ E
<u>A, B, C, E</u>	$\frac{BD}{6}, \frac{ED}{2}, \frac{EF}{5}$	ED	2	(A) $\xrightarrow{3}$ C $\xrightarrow{2}$ B $\xrightarrow{3}$ E $\xrightarrow{2}$ D
A B C D E	$\frac{DF}{3}, \frac{EF}{5}$	DF	3	(A) $\xrightarrow{3}$ C $\xrightarrow{2}$ B $\xrightarrow{3}$ E $\xrightarrow{2}$ D $\xrightarrow{3}$ F
A B C D E F			Total = 13	<u>MCST</u> .

Method 2. → Using Prims to find MST.

## Knapsack Problem →

We are given an empty sack of capacity 'm'.

We were given n diff objects and their weights.

Weight of object i is represented as w[i] and profit as p[i]

We want to fill the sack with total capacity 'm'

Such that profit always remains maximum.

Let  $x[i]=0$  if  $i^{\text{th}}$  object is not added in sack.  
 $x[i]=1$  if  $i^{\text{th}}$  object is added in sack.

The problem is to Maximize

$$\sum_{i=1}^n p_i \times x_i$$

↓  
↑ Profit ↑ Total weight

Subjected to

$$\sum_{i=1}^n w_i \times x_i \leq m$$

Consider  $m=15$ ,  $n=7$

$P_1$	$P_2$	$P_3$	$P_4$	$P_5$	$P_6$	$P_7$
10	5	15	7	6	18	3

$w_1$	$w_2$	$w_3$	$w_4$	$w_5$	$w_6$	$w_7$
2	3	5	7	1	4	1

### Type 1 Fractional Knapsack.

Step 1 → Find  $P/W$  of each object [Per Unit (wt)].

Object	Profit	Weight	$P/W$
1	10	2	5
2	5	3	1.67
3	15	5	3
4	7	7	1
5	6	1	6
6	18	4	4.5
7	3	1	3

4

Step 2) Arrange the objects in Descending order of  $P/W$

Object	Profit	Weight	$P/W$
5	6	1	6
1	10	2	5
6	18	4	4.5
3	15	5	3

6	10	1	
3	15	5	3
7	3	1	3
2	5	3,	<u>1.67</u>
n	7	7	1

Step 3) capacity =  $m = \underline{\underline{15}}$

Object Added	Weight	Remaining capacity	Profit earned.
5	1	14	6
1	2	12	$6+10=16$
6	4	8	$16+18=34$
3	5	3	$34+15=49$
7	1	2	$49+3=52$
2	2	0	$52 + \underline{\underline{1.67 \times 2}} = 55 - 34$

$$\text{Total profit} = 55 - 34.$$

In Fractional Knapsack we are allowed to take fraction of object that will satisfy the capacity.

D/I Knapsack → Here fraction of object is not Allowed -

(constraint)  $m=15$ ,  $n=7$

The object has to be completely taken or rejected.

$P_1$	$P_2$	$P_3$	$P_4$	$P_5$	$P_6$	$P_7$
10	5	15	7	6	18	3

$w_1$	$w_2$	$w_3$	$w_4$	$w_5$	$w_6$	$w_7$
2	3	5	7	1	4	1

### Type 2 D/I Knapsack.

Step 1 → Find P/W of each object [Per Unit (wt)].

Object	Profit	Weight	P/W
1	10	2	5
2	5	3	1.67
3	15	5	3
4	7	7	1
5	6	1	6
6	18	4	4.5
7	3	1	3

↑

Step 2 → Arrange the objects in Descending order of P/W

Object	Profit	Weight	P/W
1 → 5	6	1	6
2 → 1	10	2	5
3 → 6	18	4	4.5
4 → 3	15	5	3
5 → 7	3	1	3
6 → 2	5	3	1.67
7 → n	7	7	1

$$14 - 2 \geq 0 \text{ Yes}$$

$$C = 12$$

$$P = 6 + 10 = 16$$

$$12 - 4 \geq 0 \text{ Yes.}$$

$$C = 8$$

Step 3) capacity =  $m = 15$

Object	Weight	Remaining C	Profit

$$C - w[i] \\ 12 - 3 \geq 0 \text{ No}$$

Step 3) capacity

Object Added	Weight <small>W<sub>i,j</sub></small>	Remaining capacity <small>C</small>	Profit earned <small>P<sub>i,j</sub></small>
5	1	14	6
1	2	12	$6+10=16$
6	4	8	$16+18=34$
3	5	3	$34+15=49$
7	1	2 //	$49+3=52$

C = 2

Here remaining capacity is  $\underline{\underline{2}}$

but weight of object (Remaining object)  $\geq \underline{\underline{2}}$

So we will reject both the object

$\therefore$  Total profit =  $52$ .

& capacity is not utilized.

## Greedy Algo for Knapsack Problem

Given an empty knapsack of capacity 'm' and n diff object. Weights and profit for all n objects are stored in array w & p.

We want to fill the knapsack with entire capacity m such that the profit earned is maximum.

Algo Knapsack(m, n, w[], p[])

q // Sort the p & w in descending order of p/w ✓

Let c = m ; ✓

profit = 0;

// Fill the sack

for (i=1 to n) // arranged in descending order of - p/w

{ if (remaining capacity  
c - w[i] >= 0)

    { c = c - w[i]; 14

profit = profit + p[i];  
        + 6 = 6

        Display object added with weight w[i]

        & profit p[i];

    }

else

    break;

}

$\text{if } (\underline{i \leq n})$

$\text{profit} = \underline{\underline{\text{profit}}} + \frac{1.67 \times \underline{\underline{c}}}{1.67}$

Display object with weight  $c$  and  
Profit earned  $(P[i]/w[i]) * c$

}

} display max profit = profit ;

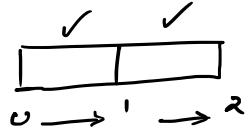

Greedy Approach →

Job Sequencing with Deadline →

- \* Given  $n$  different jobs to be performed using single machine.
- \* Profit and deadline for each job is specified.
- \* One job can be performed at a time.
- \* Every job requires one unit of time.
- \* We want to find subset of the given job such that all the jobs in the subset are completed within their deadline and profit earned is maximum.

Ex

job	1	2	3	4
profit	100	15	10	27
deadline	2,	1,	2,	1,

Possible Sol → ①  $\langle 1, 3 \rangle \Rightarrow 100 + 10 = 110$   
 $\begin{matrix} 0 & - & 1 \\ & & 1 - 2 \end{matrix}$

②  $\langle 2, 1 \rangle \Rightarrow 15 + 100 = 115$   
 $\begin{matrix} 0 & 1 \\ & 1 - 2 \end{matrix}$

Sol → sol: Arrange the jobs in descending order of profit.

job	1	4	2	3
profit	100	27	15	10

Job	1	2	3	4
Profit	100	27	15	10
Deadline	2	1	1	2

Step 2 → ① Add job 1 to the sol.

$J = \{ \underset{0-1}{\underline{1}} \} \rightarrow$  Done  $\Rightarrow$  profit earned = 100.

② Add job 2 to the sol.

Since deadline of job 2 is 1

and job 1 is 2

Switch the order of ex.

$J = J \cup \{ \underset{\substack{0-1 \\ Job 2}}{\underline{2}}, \underset{1-2}{\underline{1}} \} \Rightarrow 27 + 100 = \underline{\underline{127}}$

Given the time limit we cannot add other job.

High level description.

Algo  $JSD(d, J, n)$

of //  $J \rightarrow$  set of jobs that can be completed by deadline.

$J_1 = d \{ \}$  // job with highest profit

for ( $i = 2$  to  $n$ ) do // for all job from  $d$  to  $n$ .

if all job in  $J \cup \{ i \}$  can be completed  
by deadline then

J = Jv{ $\ddot{\gamma}$ }.

# Compare Divide & Conquer & Greedy

## Divide & Conquer.

- ① To obtain solution of given problem.
- ② Problem is divided into Sub problems and sol<sup>n</sup> of Sub problems are combined together to get sol of problem.
- ③ Here Duplicate sol<sup>n</sup> may be obtained.
- ④ less efficient as there is rework on sol<sup>n</sup>
- ⑤ Ex: Binary Search  
Merge Sort

## Greedy.

- ① used to obtain optimal Solution.
- ② Set of feasible sol<sup>n</sup> is generated and optimal is selected.
- ③ The optimal is selected without revisiting previous sol.
- ④ More efficient than Divide & conquer but it cannot guarantee optimal sol<sup>n</sup>
- ⑤ Ex: Knapsack  
finding MST.

(Q) Solve the problem of Job Sequencing with Deadline.

X ✓ ✓ ✓

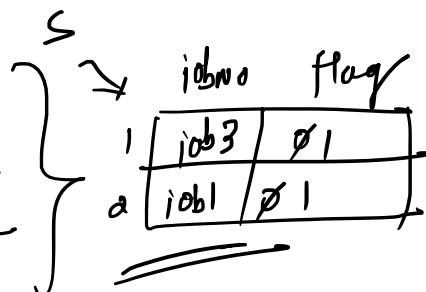

Job	Profit	Deadline
1	100	?
2	15	1
3	27	2
4	10	1

Sol  $\Rightarrow$  job no

job 3	Job 1
1	2

flag

0	1	0	-1
1	2	2	"

Step 1 Consider jobs in Descending order of profit.

Consider Job 1.

$$d(\text{Job 1}) = 2$$

check slot(2)

$$s(2) \cdot \text{job no} = \text{Job 1}$$

$$s_2 \cdot \text{flag} = 1$$

$$\text{Profit} = 0 + 100 = 100$$

Consider Job 3

$$d(\text{Job 3}) = 2$$

check slot 2  $\Rightarrow$  Not Empty.chk for slot 1 = Empty (return 1)

$$s(1) \cdot \text{job no} = \text{Job 3}$$

$$s_1 \cdot \text{flag} = 1$$

$$\text{Profit} = 100 + 27 = \underline{\underline{127}}$$

Consider Job 2

$$d(\text{Job 2}) = 1$$

chk slot 1 = Not Empty

Job 2 cannot be  
scheduled

Consider Job 4

$$d(\text{Job 4}) = 1$$

chk slot 1 = Not Empty

Job 4 cannot be  
scheduled.

profile =  $\{j_1^7, j_2^3, j_3^1\}$   
schedule =  $\{j_1^3, j_2^1\}$

Q)  $(P_1, \dots, P_7) = (3, 5, 20, 18, 1, 6, 30)$  } Solve Job Sequencing Deadline  
 $(d_1, \dots, d_7) = (1, 3, 4, 3, 2, 1, 2)$  } with Greedy Approach.

slot	Job	P	d.
1	1	3	1
2	2	5	3
3	3	20	4
4	4	18	3
5	-	1	2
6	6	6	1
7	7	30	2

Highest deadline =  $d_7 = 4$  slot

Slot →

slot	Job No	flag
0	Job 6	0 1
1	Job 7	0 1
2	Job 4	0 1
3	Job 3	0 1

① Consider job 7.  
 $d(\text{job}7) = 2$

chk slot 2 ⇒ Empty.

$$s(2) \cdot \text{job\_no} = 7$$

$$s(2) \cdot \text{flag} = 1$$

$$\text{Profit} = 30$$

② Consider job 3

$$d(\text{job}3) = 4$$

chk slot 4 = Empty.

$$s(4) \cdot \text{job\_no} = \text{job}3$$

$$s(4) \cdot \text{flag} = 1$$

$$\text{Profit} = 30 + 20 = 50$$

Consider job 4

$$d(\text{job}4) = 3$$

chk slot 3 = Empty.

$$s(3) \cdot \text{job\_no} = \text{job}4$$

$$s(3) \cdot \text{flag} = 1$$

$$\text{Profit} = 20 + 18 = 58$$

④ Consider job 6

$$d(\text{job}6) = 1$$

chk slot 1 = Empty.

$$s(1) \cdot \text{job\_no} = \text{job}6$$

$$s(1) \cdot \text{flag} = 1$$

$$\text{Profit} = 68 + 6 = 74$$

Now Since all the slots are occupied.

So no other jobs can be scheduled.

$$\text{Total Profit} = 74.$$

Schedule → job 6 → job 7 → job 4 → job 3.

## Algo for Job Sequencing with Deadline.

function GetSlot( $s$ ,  $dl$ ) : Integer

{ // will send the slot deadline and will return whether the slot is full or not

$s(1:k)$  : Here the schedule contains job no and flag.

$\underline{dl} \Rightarrow \text{deadline}$

1. start
2. for ( $i = dl$  to 1)
3. if ( $s(i).flag = 0$ )  
    return  $i$
4. return -1;

}

## Algo for function Job Sequencing. ( $X, n, S, K$ )

where

$X(1:n)$  : Input array containing  $x.j$  (job no),  $x.p$  (profit)-  
and  $x.d$  (deadline).

$n$  = no of slots available (equal to target deadline value).

$S(1:\underline{k})$  = Schedule contains Jobno and flag  
for  $k$  scheduled job out of  $\underline{n}$

1. start

2. Profit = 0

3. Sort all the jobs in descending order of profit.

4. for ( $i=1$  to  $n$ )  $\Rightarrow$   $i=1$  job with highest profit.

5. { avail = GetSlot(s,  $x(i).d$ )

6. if (avail == -1) then

7. print "job  $x(i).j$  cannot be scheduled"

else

8.  $s(avail).jobno = \underline{\underline{x(i).j}}$ ;

9.  $s(avail).flag = 1$

10. profit = profit +  $x(i).p$ .

11. Print S (schedule).

12. Print Profit

13. Return:

# Dynamic Programming

## Assembly line Scheduling →

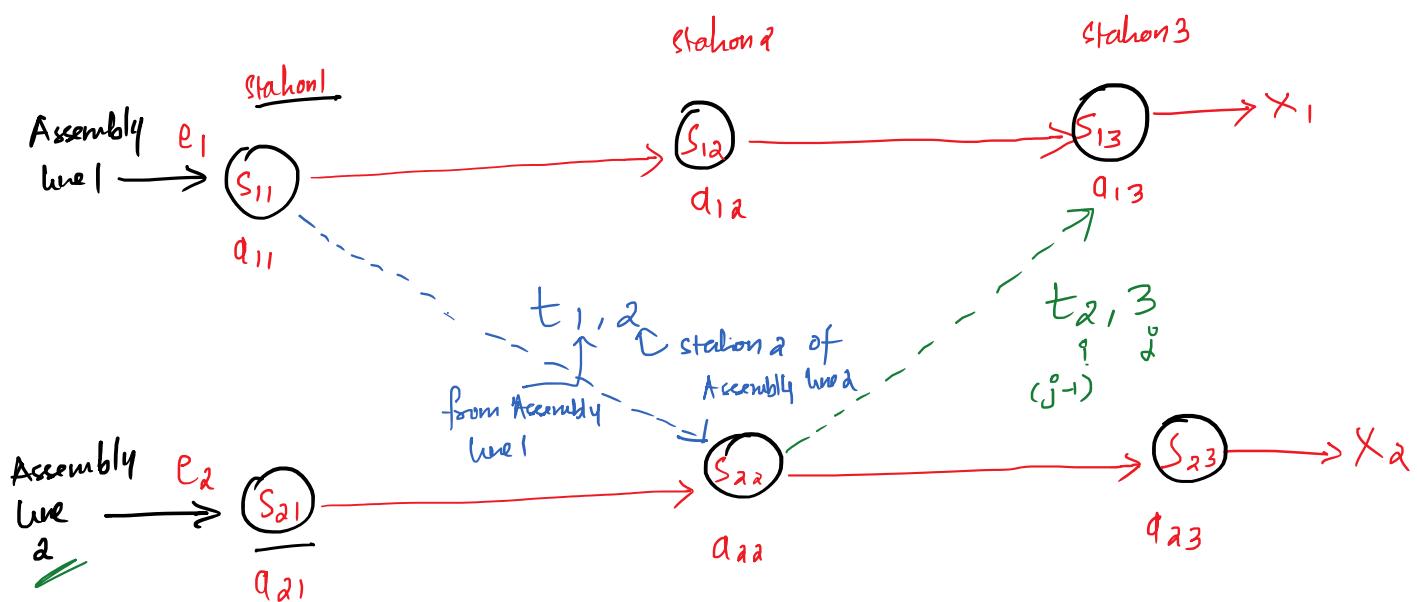

\* A factory has 2 assembly line with  $n$  stations each.

\* A station is denoted as  $S_{i,j}$

↑  
 assembly  
line no  
 ↓  
 station  
no

$i$  = Assembly line no

$j$  = Station no.

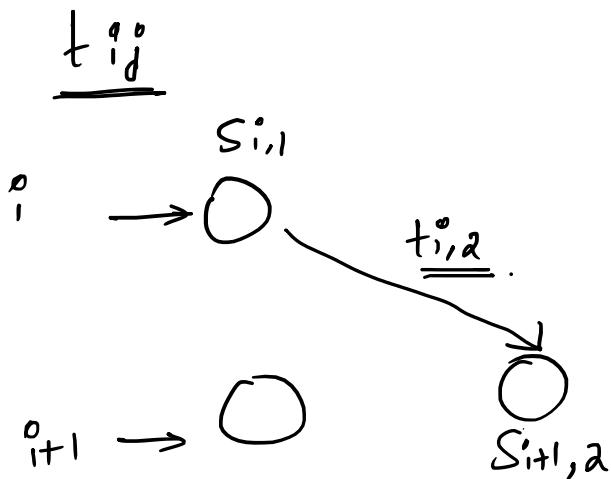

$t_{i,j} \rightarrow$  Time required to switch from station  $(j-1)$  ie 1 of assembly line  $i$  to station  $j$  (2) of other assembly line.  $(1+1=2)$

Please  $a_{i,j} \rightarrow$  Time taken on Assembly line  $i$  & station  $j$ .

1...if want pass through each of  $n$  stations in order.

- \* Product must pass through each of  $n$  stations in order before exiting the assembly line.
- \* The parallel station of the two assembly line performs the same task.
- \* After product passes through  $S_{i,j}^o$  then would continue to  $S_{i,j+1}^o$  unless it decides to shift to other Assembly line.
- \* Continuing on same assembly line takes no extra cost.
- \* But transferring from assembly line  $i$  at station  $j-1$  to station  $j$ , on other assembly line will take

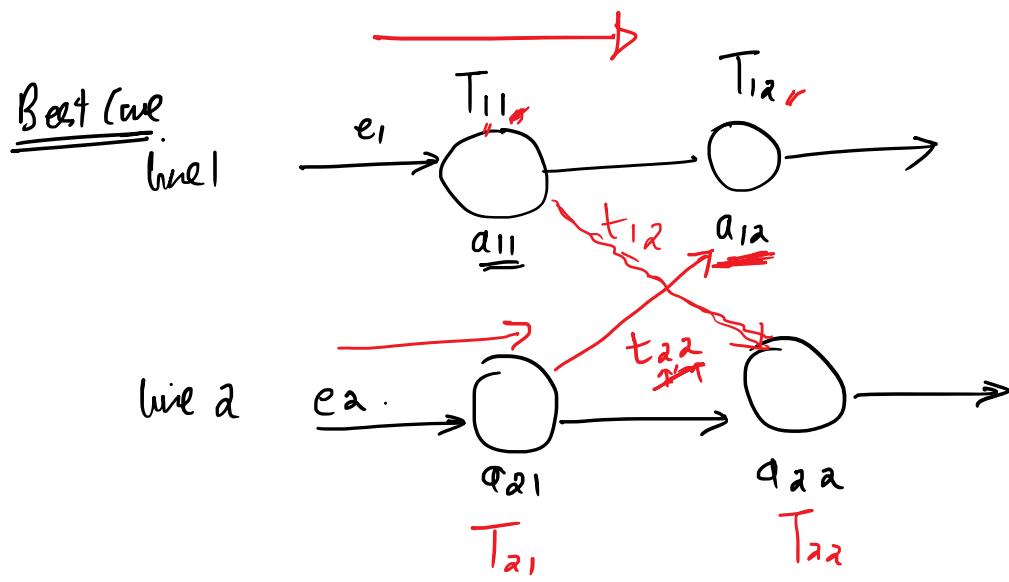

- \* Each assembly line takes an entry time  $e^o$
- \* Each assembly line takes an exit time  $x^o$
- \* Entry and Exit Time may be diff for diff assembly line.

Approach  $\hookrightarrow$  The decision involves determining whether the assembly line should be switched or not.

$T_{1,j}^o \Rightarrow$  Indicates min time taken to leave station  $j$  on assembly line 1.

$T_{2,j} \Rightarrow$  " " " " " " " " on assembly line 2.

Total time to leave Station 1.

$$T_{11} = e_1 + a_{11} \leftarrow \text{entry time in assembly line} + \text{Time spent on station 1.}$$

$$T_{21} = e_2 + a_{21}$$

$$T_{12} = \min \left\{ \begin{array}{l} T_{11} + a_{12} \\ T_{21} + t_{22} + a_{12} \end{array} \right\}$$

$\left. \begin{array}{l} \text{Coming from station 1 of line 1} \\ \text{Time spent on 2nd line 1} \end{array} \right\}$

$\left. \begin{array}{l} \text{Time taken to leave station 1 of line 1} \\ \text{Time to ...} \end{array} \right\}$

$\left. \begin{array}{l} \text{Time spent on 2nd of line 1} \\ \text{...} \end{array} \right\}$

leave st<sup>n</sup> 1  
 of line 2  
 time to switch  
 form line 2 st<sup>n</sup> 1  
 to line 1 st<sup>n</sup> 2

$$T_{22} = \min \left\{ \begin{array}{l} T_{21} + a_{22} \\ \text{(coming from line 2)} \\ T_{11} + t_{12} + a_{22} \\ \text{(coming from line 1)} \end{array} \right.$$

Total Time taken to Come out of factory  $\Rightarrow$  There are  $n$  stations

$$T_{\min}^4 = \min \left\{ \begin{array}{ll} \overline{T_{1,n}} & \overline{T_{2,n}} \\ \text{Assembly line 1} & \text{Assembly line 2} \\ \overline{T_{1,n}} & \overline{T_{2,n}} \\ + x_1 & + x_2 \\ \text{Exit time} & \\ \text{of station } n & \\ \text{Assembly 1} & \text{Assembly 2.} \end{array} \right\}$$

Problem $n=4$  (No of stations)

$$a(2,4) = \{ \{ 4, 5, 3, 2 \}, \{ 2, 10, 1, 4 \} \}$$

$a_{11} \quad a_{12} \quad a_{13} \quad a_{14} \quad a_{21} \quad a_{22} \quad a_{23} \quad a_{24}$ .

$$t(2,4) = d \left( \begin{matrix} 0, & 7, & 4, & 5 \\ \uparrow & \uparrow & \uparrow & \uparrow \\ e_1 & e_2 \end{matrix} \right), \left( \begin{matrix} 0, & 9, & 2, & 8 \\ \uparrow & \uparrow & \uparrow & \uparrow \\ x_1 & x_2 \end{matrix} \right)$$

$$e(1,2) = d \left\{ \begin{matrix} 10, & 12 \\ \uparrow & \uparrow \\ e_1 & e_2 \end{matrix} \right\}$$

$$x(1,2) = d \left\{ \begin{matrix} 18, & 7 \\ \uparrow & \uparrow \\ x_1 & x_2 \end{matrix} \right\}$$

Sol → .

$a$	1	2	3	4
1	4	5	3	2
2	2	10	1	4

$t$	1	2	3	4
1	0	7	4	5

Multistage Graph → Using Dynamic Programming →

Example → Shortest path from Source to Sink ( $t$ )

- Observations →
- ① All the edges are directed
  - ② The edge has some direction from Source toward Sink.
  - ③ The edges are from  $\underline{\underline{i-1^{th}}}$  stage to  $\underline{\underline{i^{th}}}$  stage
  - ④ We divide the overall graph into diff stages and collect the nodes in form of stages.

Ex In stage 1 = {1, 2}

Stage 2 = {2, 3, 4, 5}

Stage 3 = {6, 7, 8}

Stage 4 = {9, 10, 11}

Stage 5 = d12?

Sol<sup>n</sup> → we will start from Sink and this approach is known as forward approach.

Step 1 → Stage 5

$$\text{cast}(5, 12) = 0$$

↑ Stage NO      ↑ node no

[ Stage 5 pe node 12 se  
range ka cast ]

Step 2: Stage 4

$$\text{cast}(4, q) = \underline{\underline{C_{q,12}}} = 4 , \quad D(4, q) = 12$$

Stage      ↑ node no      ↓ cast of edge q-12

Decision take to go  
to which node from node q  
at stage 4

$$\text{cast}(4, 10) = \underline{\underline{C_{10,12}}} = 2 , \quad D(4, 10) = 12$$

$$\text{cast}(4, 11) = \underline{\underline{C_{11,12}}} = 5 , \quad D(4, 11) = 12$$

Stage 3

$$\text{cast}(3, 6) = \min_q \left\{ \begin{array}{l} \frac{C_{6,q}}{\substack{\text{edge 6 to} \\ q}} + \underline{\underline{\text{cast}(4, q)}} , \quad \downarrow \\ \underline{\underline{C_{6,10}}} + \underline{\underline{\text{cast}(4, 10)}} \end{array} \right\}$$

$$= \min \left\{ 6 + 4 , \underline{\underline{5 + 2}} \right\}$$

-

$$= 7$$

$$\boxed{D(3,6) = 10}$$

$$\begin{aligned} \text{cost}(3,7) &= \min \left\{ \underline{(7,9 + \text{cost}(4,9))}, \underline{(7,10 + \text{cost}(4,10))} \right\} \\ &= \min \left\{ h+k, \underline{\underline{3+2}} \right\} \end{aligned}$$

$$\boxed{D(3,7) = 10}$$

$$\begin{aligned} \text{cost}(3,8) &= \min \left\{ \underline{(8,10 + \text{cost}(4,10))}, \underline{(8,11 + \text{cost}(4,11))} \right\} \\ &= \min \left\{ \underline{\underline{5+2}}, \underline{6+5} \right\} \\ &= 7 \end{aligned}$$

$$\boxed{D(3,8) = 10}$$

Stage 2

$$\begin{aligned} \text{cost}(2,2) &= \min \left\{ \underline{(2,6 + \text{cost}(3,6))}, \underline{(2,7 + \text{cost}(3,7))}, \right. \\ &\quad \left. \underline{(2,8 + \text{cost}(3,8))} \right\} \end{aligned}$$

$$\begin{aligned} &= \min \left\{ h+k, \underline{\underline{2+5}}, l+j \right\} \\ &= 7 \end{aligned}$$

$$\boxed{D(2,2) = 7}$$

$$\text{cost}(2,3) = \min \left\{ \underline{(3,6 + \text{cost}(3,6))}, \underline{(3,7 + \text{cost}(3,7))} \right\}$$

$$= \min \left\{ \underline{\underline{2+7}}, 7+5 \right\}$$

$$= 9$$

$$\boxed{D(2,3) = 6}$$

$$\text{cost}(2,4) = \min \left\{ c_{1,8} + \text{cost}(3,8) \right\}$$

$$= 11+7 = 18$$

$$\boxed{D(2,4) = 8}$$

$$\text{cost}(2,5) = \min \left\{ c_{1,7} + \text{cost}(3,7), c_{1,8} + \text{cost}(3,8) \right\}$$

$$= \min \left\{ \underline{\underline{7+5}}, 8+7 \right\}$$

$$= 12$$

$$\boxed{D(2,5) = 7}.$$

Stage 1 ->

$$\text{cost}(1,1) = \min \left\{ c_{1,2} + \text{cost}(2,2), c_{1,3} + \text{cost}(2,3), c_{1,4} + \text{cost}(2,4), c_{1,5} + \text{cost}(2,5) \right\}$$

$$= \min \left\{ 9+7, 7+9, 3+18, \underline{\underline{2+12}} \right\}$$

$$= \min \left\{ 16, 16, 21, \underline{\underline{14}} \right\}$$

$$= \underline{\underline{14}}$$

$$\boxed{D(1,1) = 5}$$

Path  $\rightarrow$  . - - -

$$D(1, 1) \Rightarrow S$$

↑  
Stage 2

$$D(2, 5) \Rightarrow 7$$

↑  
Stage 3

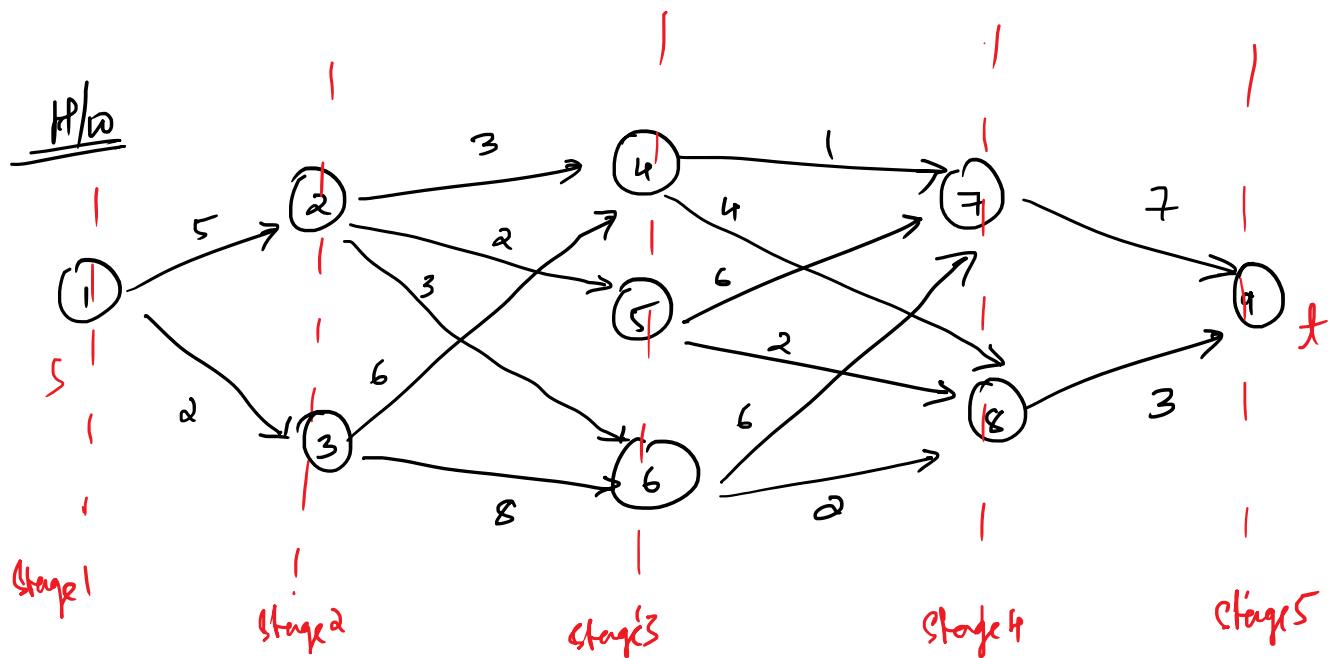

Path  $1 \rightarrow 5 \rightarrow 7 \rightarrow 10 \rightarrow 12$

$$D(3, 7) = 10$$

↑  
Stage 4

Cost = 14.

$$D(4, 10) = 12.$$

Multistage Graph  $\rightarrow$  It is directed graph where the vertices are partitioned into  $K$  disjoint subsets  $K \geq 2$

Stages are represented as  $v_1, v_2, v_3, \dots, v_K$

If edge  $(u, v) \in E(g)$

Then if  $u \in V^0$  [ ${}^0\text{th stage}$ ]

Then  $v \in V^{0+1}$  [ ${}^{0+1}\text{th stage}$  (next stage)].

Here  $v_1$  is Source

$v_K$  is Sink.

Here Cost of Path from Source ( $s$ ) to Sink ( $t$ ) is sum of Cost of all the edges on path from s to t.

Approach  $\rightarrow$  Here we implement forward approach where the decision involves vertex from next stage to be taken along the path.

$$\text{Cost}(i, j) = \min \left\{ \underset{\substack{\text{stage} \\ \text{no}}} \underset{\substack{\text{vertex} \\ \text{no}}} {c_{j,l}} + \underset{\substack{\text{cost of} \\ \text{edge from} \\ \text{vertex } j \text{ to} \\ \text{some vertex } l \\ \text{of stage } i+1}} {\text{forward cost}} \right\}$$

cost of  
edge from  
vertex  $j$  to  
some vertex  $l$   
of stage  $i+1$ 

 forward cost  
from vertex  $l$   
of stage  $i+1$  to  
sink.

Please  $l \in \overline{V_{i+1}}$   
one vertex of next stage.

any vertex of next stage.

$D(i,j) =$  Decision taken on stage i at vertex j to go to some vertex l in stage i+1 of Minimum Cost

Algo → function m-stage graph( $C, \leq, n, p$ )

of Here  $C$  = cost matrix (adjacency matrix with cost  
 $k$  = no of stages  
 $n$  = no of vertex  
 $P$  = path array.

Integer Const :  $\text{cost}[l:n], D[1:n], f, r, \min$ .

1. Start  
2.  $\underline{\text{cost}(n)} = 0$   
3. for  $j = \underline{n-1}$  to 1

$f_{\min} = \infty$   
for ( $r = 1$  to n) do

if ( $c(j,r) \neq 0$  &  $c(j,r) + \underline{\text{cost}(r)} < \underline{\min}$ )

$\underline{\min} = c(j,r) + \underline{\text{cost}(r)}$   
 $P_{\min} = r$

$\underline{\text{cost}(j)} = \underline{\min}$ :

$D(j) = \underline{P_{\min}}$

?

$$\left. \begin{array}{l} P(1) = 1 \\ \vdots \end{array} \right\} \begin{array}{l} \text{stage} \\ \text{vector} \end{array}$$

$\left. \begin{array}{l} \\ \\ \end{array} \right\} \begin{array}{l} \text{first stage vector} \\ \text{1} \end{array}$

$$P(k) = n \quad \left. \begin{array}{l} \text{k}^{\text{th}} \text{ stage} \\ \text{vector} \end{array} \right\} n.$$

for ( $j = 2$  to  $k-1$ )  $\left. \begin{array}{l} \text{stage} \\ \text{from } 2 \text{ to } k-1 \end{array} \right\}$ .

$$\underline{P(j)} = D(\underline{P(j-1)})$$

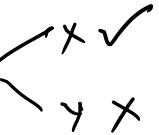

return;

$\left. \begin{array}{l} \\ \\ \end{array} \right\} .$

Longest Common Subsequence →

Consider  $X = \underline{A} \underline{B} \underline{C} \underline{B} \triangleright \underline{A} \underline{B}$

$Y = \underline{B} \underline{D} \underline{C} \underline{A} \underline{B} \underline{A}$

Possible Common Subsequence →  $A \ B \ B \ A$  {  
 } Not Common Subsequence -

$B \ C \ A \ B$  {  
 } Common Subsequence.

There can be many possible Common Subsequence.

We want longest common subsequence.

## Appn ① Molecular Biology

A DNA sequence is represented as sequence of 4 letters A,C,G,T, Using LCS

we can find common subsequences to match DNA strands.

② LCS can also be used to determine 2 versions of same file by finding LCS of lines of 2 files.

Trick  $\Rightarrow$  if ( $x == y$ )  
 {     then value = diag + 1  
       and arrow =  $\nwarrow$ (diag)  
 }  
 else if (upper  $\geq$  left)  
 {     value = upperwhile  $\leftarrow$  a value -  
       arrow =  $\uparrow$  (up)  
 }  
 else {     value = leftwhile  $\leftarrow$  a value  
       arrow =  $\leftarrow$  left  
 }

Highest Common Subsequence  $\rightarrow$  (LCS)

\* We will solve it using Dynamic Programming

\* LCS of 2 sequences is a subsequence with maximum length, which is common to both the Sequence

Consider  $x = A \overset{\checkmark}{B} C \overset{\checkmark}{B} \overset{\checkmark}{D} A B$   
 $y = \underset{\checkmark}{B} \overset{\checkmark}{D} C \overset{\checkmark}{A} B A$

Also  $y = \begin{matrix} & \checkmark & \checkmark \\ \checkmark & B & D \\ & \checkmark & C \\ & \checkmark & A \\ & B & A \end{matrix}$   
B CBA is also common subsequence

Try Kaste  $\boxed{B \overset{\checkmark}{D} A B}$  is common subsequence

Also  $x = A B C \overset{\checkmark}{B} \overset{\checkmark}{D} A B$   
 $y = B D \overset{\checkmark}{C} A B A$

$\boxed{C \overset{\checkmark}{A} B}$  is also common subsequence

Also  $x = A B C \overset{\checkmark}{B} \overset{\checkmark}{D} A B$   
 $y = B \overset{\checkmark}{D} C \overset{\checkmark}{A} B A$

$\boxed{D A B}$  is also common subsequence

Longest Common Subsequence =  $4 = \boxed{B \overset{\checkmark}{D} A B}$

Consider  $x = \overset{\checkmark}{a} \overset{\checkmark}{b} d \overset{\checkmark}{a} \overset{\checkmark}{c} e$   
 $y = b \overset{\checkmark}{a} \overset{\checkmark}{b} c \overset{\checkmark}{e}$

No common subsequence of length  $\geq 4$ .

Common Subsequence  $\Rightarrow \boxed{b a c e} \rightarrow 4$  Longest Common Subsequence  
=  $\boxed{a b c e} \rightarrow 4$   
=  $\boxed{a c e}$

→ There may be more than one LCS for given pairs of sequences

\* Can have more than one LCS for given pairs of sequences

Applicn →

① Molecular Biology →

A DNA Sequence is represented as sequence of 4 letters ACGT. Using LCS we can find the common subsequences to match the DNA strands.

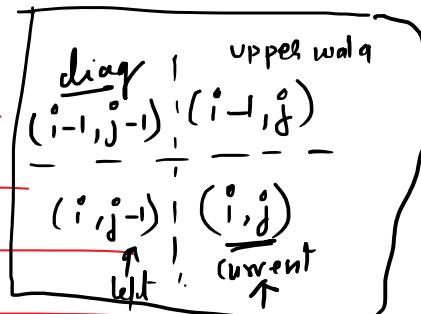

② LCS can also be used to determine 2 versions of same file by finding common subsequences of lines of 2 files.

Find LCS of the 2 Sequences Given Using Dynamic Prog.

## ④ Travelling Salesman Problem

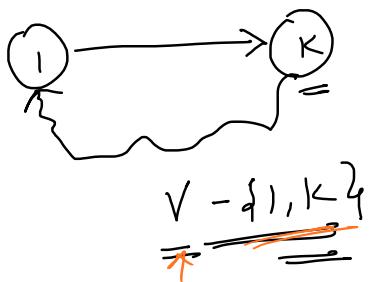

Let  $g = (V, E)$  be a directed graph with edge cost  $c_{ij}$  such that

$$c_{ij} > 0 \quad \text{if } \langle i, j \rangle \in E(g).$$

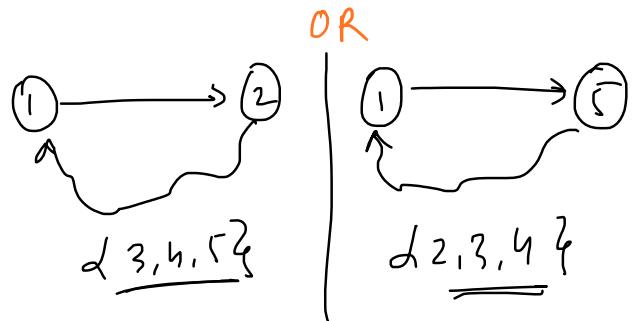

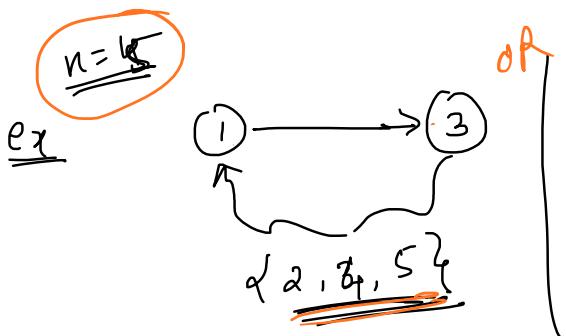

$$c_{ij} = \infty \quad \text{if } \langle i, j \rangle \notin E(g).$$

- \* A tour is a directed cycle that includes every vertex of graph  $g$ .
- \* The cost of the tour is the sum of cost of all the edges of tour.
- \* The problem is to find the tour with minimum cost.

Approach →

start from 1  
go to K  
then from K to 1  
visiting all the vertex  
other than 1, K.

A tour is a Simple path that starts and ends at same vertex.

" A graph tour consists of an edge  $\langle i, k \rangle$  for some  $k \in V - \{i\}$  and a path from vertex  $k$  to vertex  $i$  which must go through all the vertices in  $V - \{i, k\}$  exactly once.

\* Let  $g(i, S)$  be the length of the shortest path from vertex  $i$  to vertex  $j$  which must go through each vertex in set  $S$  exactly once

∴ Define  $g(i, V - \{i\})$  represent length of optimal graph tour  
if  $g(1, \{2, 3, 4\})$

(start from  $1$  come back to  $1$  visiting all the vertices in  $V - \{1\}$ )

Generalizing → from vertex  $i$  go to vertex  $j$  visiting all the vertices in set  $S$ .

$$g(i, S) = \min_{j \in S} \left( g(i, j) + g(j, S - \{i, j\}) \right)$$

use  $i$  via  $S - \{i, j\}$

To start from  $i \rightarrow$  go from  $i \rightarrow j \Rightarrow \underline{\underline{i}} \underline{j}$

then come back from  $j \Rightarrow g(j, S - \{i, j\})$

to  $\{i\}$  visiting all  
vertices  $v - \{i\}, j\}$

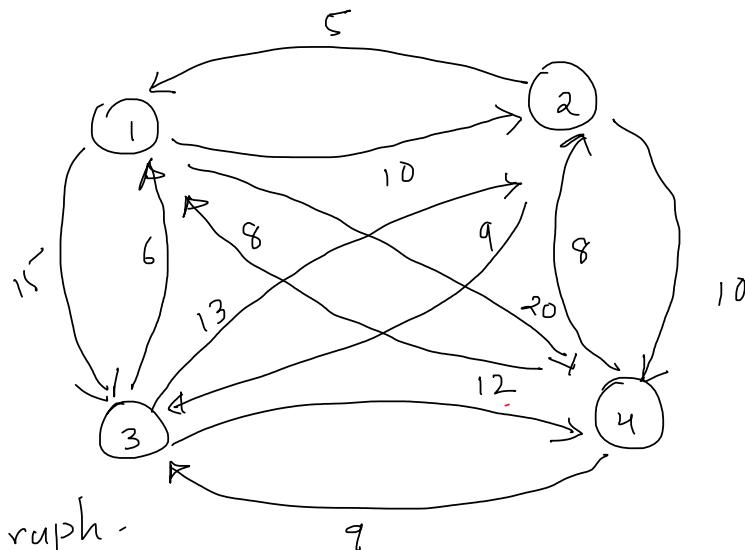

We have

$$g(C_i^0, \emptyset) = C_{i1} \quad \underline{\underline{C_i^0 \rightarrow 1}}$$

from vertex  $i$  to 1  
visiting no other nodes since  $\emptyset$

Question

Find Min Tour  
Cost of Given Graph.

Start tour from vertex 1

Sol  $\rightarrow |S| = 0$

$$g(2, \emptyset) = C_{21} = \underline{\underline{5}}$$

$$g(3, \emptyset) = C_{31} = \underline{\underline{6}}$$

$$g(4, \emptyset) = C_{41} = \underline{\underline{8}}$$

|S| = 1  $\rightarrow$  from 2 to 1 via 3  $\Rightarrow \underline{\underline{2 \rightarrow 3}} \text{ then } \underline{\underline{3 \rightarrow 1}}$

$$g(2, \{3\}) = C_{23} + g(3, \emptyset) = 9 + 6 = 15$$

$$g(2, \{4\}) = C_{24} + g(4, \emptyset) = 10 + 8 = 18$$

$$\therefore \lambda = (2, \{3, 4\}) = 13 + 5 = 18$$

} From any  
vertex other  
than 1  
remaining

$$g(\alpha, \alpha^{++})$$

$$g(3, d\{2\}) = \underline{3}_2 + g(2, \emptyset) = 13 + 5 = 18$$

$$g(3, d\{4\}) = \underline{3}_4 + g(4, \emptyset) = 12 + 8 = 20$$

$$g(4, d\{2\}) = \underline{4}_2 + g(2, \emptyset) = 8 + 5 = 13$$

$$g(4, d\{3\}) = \underline{4}_3 + g(3, \emptyset) = 9 + 6 = 15.$$

$$d(4, d\{3\}) \Rightarrow 3$$

Than I  
coming  
back to one  
using only  
one intermediate  
vertex

$$|S| = 2$$

$2 \leftarrow 3$  then  $3 \leftarrow 1$  via 4

$\min \left( \underline{2}_3 + g(3, d\{4\}), \underline{2}_4 + g(4, d\{3\}) \right)$

$= \min(9 + 20, 10 + 15) = \min(29, 25) = \underline{\underline{25}}$

Bellman Ford Algorithm (SSSP) Single Source Shortest Path (Dijkstra's Algo).

Note: Dijkstra's Algo is used to calculate

-1 Shortest path from source to dest<sup>n</sup>

But if any edge of graph has -ve weight

then Dijkstra's Algo will fail.

$\rightarrow$  So if edge of a Graph is -ve Then we will not

Use Dijkstra's Algo, instead we will use

## Bellman Ford Algorithm

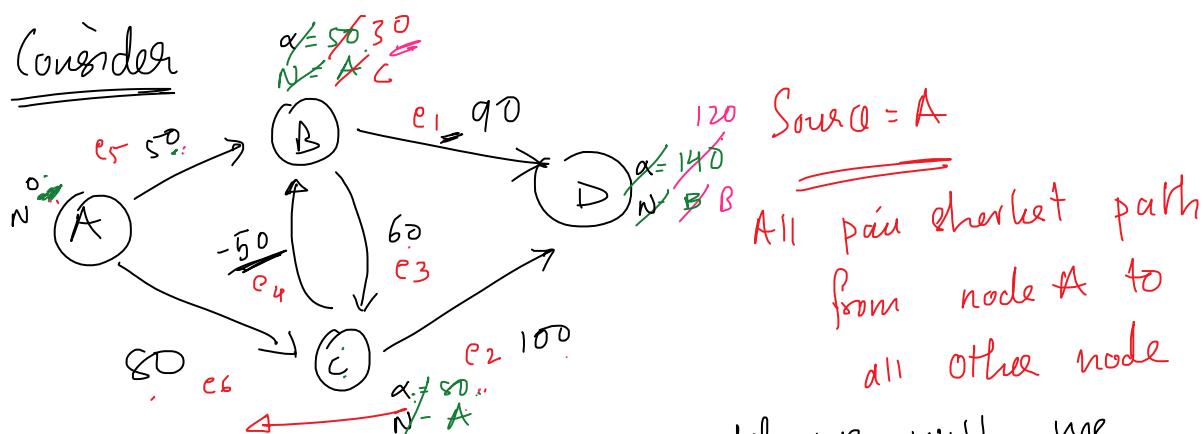

\* Bellman's rule can also be used when all

the edges are the

$\Rightarrow$  If there is no weight cycle then even

Bellman Ford Algo will fail

## Consider

Since edge  $C \rightarrow B$  is -ve weight, we will use  
 $\neg \vdash I \vdash H \vdash \text{goal from } e_1 \rightarrow e_n$

Since edge  $C \rightarrow B$  is -ve weight, we will run  
Bellman Ford Alg

		A	B	C	D	
		distance	$\infty$	$\infty$	$\infty$	$\infty$
Start = A (source)	path	NULL	NULL	NULL	NULL	
		0	50	80	$\infty$ NULL	
check edge $e_1 \rightarrow e_6$	$i=1$	NULL	A	A		
		0	30	80	140	
check from $e_1 \rightarrow e_6$	$i=2$	0	30	80	140	
		NULL	C	A	B	
check from $e_1 \rightarrow e_6$	$i=3$	0	30	80	120	
		NULL	C	A	B	
check from $e_1 \rightarrow e_6$	$i=4$	0	30	80	120	
		NULL	C	A	B	

$$A \rightarrow A = 0$$

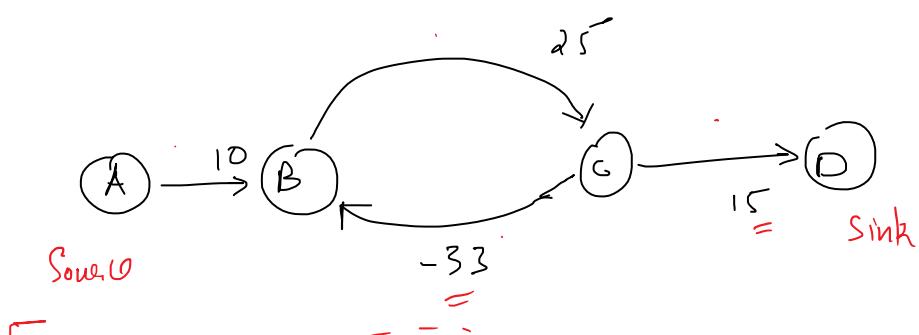

$$A \rightarrow B \Rightarrow 30 \text{ via } C.$$

$$A \rightarrow C = 30$$

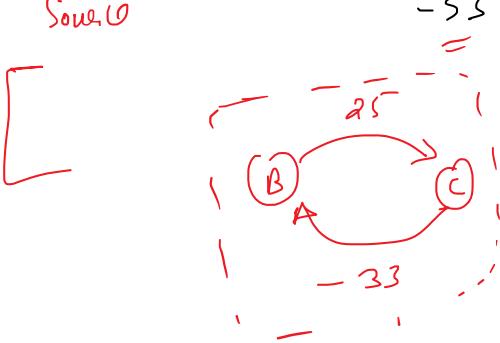

$$A \rightarrow D \Rightarrow 120 \text{ via } B$$

We solved it using Bellman Ford

Consider An Example of -ve weight cycle

Source

$$1^{\text{st}} \text{ round } B \rightarrow C \rightarrow B = \text{cut} = \underline{-8}$$

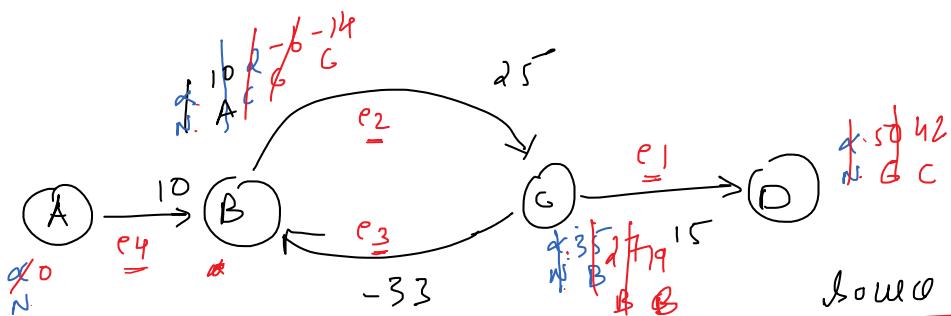

$$\text{and Round} = \underline{-8} + \underline{25} - \underline{33} = \underline{-16}$$

$$3^{\text{rd}} \text{ Round} = \underline{-16} + \underline{25} - \underline{33} = \underline{-24}$$

Because there is -ve weight cycle  $\rightarrow$  Every time going

through cycle decreases the weight cut by 8.

In above graph there is -ve weight cycle

Source = A

If weight  $\Rightarrow$   
4 iterations

	A	B	C	D
Source A	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>
	Null	Null	Null	Null
from e <sub>1</sub> to e <sub>1</sub> (i=1)	0	10	∞	∞
	Null	A	Null	Null
from e <sub>1</sub> to e <sub>2</sub> (i=2)	0	2	35	∞
	Null	C	B	Null
from e <sub>1</sub> to e <sub>3</sub> (i=3)	0	-6	27	50
	Null	C	B	C
from e <sub>1</sub> to e <sub>4</sub> (i=4)	0	-14	19	42
	Null	C	B	C

} go from e<sub>1</sub> - e<sub>2</sub>

} go from e<sub>1</sub> - e<sub>3</sub>

} go from e<sub>1</sub> - e<sub>6</sub>

} go from  
e<sub>1</sub> → e<sub>6</sub>

Here every next iteration will give you cut

less than previous iteration

So the cost of shortest path from

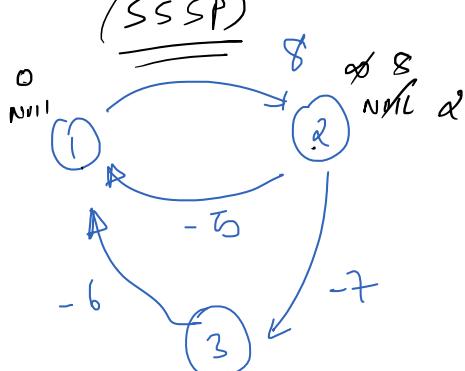

$$\begin{aligned} A \rightarrow B &\Rightarrow -\alpha \quad (\text{undefined}) \\ A \rightarrow C &\Leftarrow -\beta \quad \text{undefined} \\ A \rightarrow D &\Rightarrow -\alpha \quad \text{undefined.} \end{aligned}$$

If there is -ve weight cycle then Indefinite  
is the Answer }

Another

Way to Solve (As per Cormen)

Concide  $\rightarrow$

Some  $\alpha = 1$

go from e <sub>1</sub> to e <sub>6</sub>	$i = 4$	0 NULL	30 G	80 A-	120. B-
---	---------	-----------	---------	----------	------------

Nothing changed  
So stop.

from A to B = 30 via G  
 to C = 80 via A  
 to D = 120 via B

## Bellman Ford

\* If a graph with n vertices and  $n \geq 6$  then we need to check for a to 3 passes and if the value of array d remains same for any a consecutive pass then we will conclude that there is no negative weight cycle in the graph. \* Else we ideally need to go for n passes

### Alg for Bellman Ford

# 0/1 Knapsack Using Dynamic Programming

Fractional Knapsack  $\Rightarrow$  fraction of weight of object is allowed.

✓ If object  $\Rightarrow$  weight = 5 kg

✓ If remaining capacity = 2 kg

We are allowed to take a kg out of 5 kg

0/1 Knapsack  $\Rightarrow$  You are supposed to consider object with its whole weight and fraction is not allowed

Consider  $\Rightarrow$  capacity = 5  
 No. of object = 4.  
 $w = \{1, 3, 2, 2\}$   
 $p = \{4, 11, 6, 14\}$ .

object capacity  
 either fit with object 1  
 $c[2][2] = \max(c[1][2], 11 + c[1][2-3])$   
 $c[3][3] = (c[2][3], 6 + c[2][3-2])$   
 object capacity  
 $c[4][4] = (c[3][4], 14 + c[3][4-1])$

Using 0/1 Dynamic Knapsack  
 $j \Rightarrow$  capacity

object	0	1	2	3	4	5
1	0	4	4	4	4	4
2	0	4	4	11	15	15
3	0	4	6	11	15	17
4	0	4	14	18	20	25

Note  $\rightarrow$  from above matrix.

$$\boxed{\text{Max profit} = \underline{\underline{25}}}$$

Here chk for object 4  $\rightarrow$

Hai Ya Nahi

$$c[4][5] \neq \underline{\underline{c[3][5]}}$$

↑  
profit when  
object 4 for capacity 5

$c[3][5]$   
profit when  
obj 3 for capacity  
5.

Object 4 is added in solution

weight of object 4 is 2  
 Remaining capacity  $\Rightarrow \underline{\underline{5-2}} = \underline{\underline{3}}$

To check for obj 3

$$c[3][3] = \underline{\underline{c[2][3]}} \quad \left. \begin{array}{l} \\ \\ \end{array} \right\}$$

$= 11$                      $= 11$

means obj 3 is  
not part of the  
solution:

Now chk for obj 2

$$c[2][3] \neq \underline{\underline{c[1][3]}} \quad \left. \begin{array}{l} \\ \\ \end{array} \right\}$$

$= 11$                      $= 14$

Obj 2 is considered  
in solution

Remaining capacity  $\underline{\underline{= 3-3 = 0}}$

The object to satisfy the capacity

obj 2 + obj 4  
↓ 3      ↓ 2

Profit  $= 11 + 14 = \underline{\underline{25}}$

Soln. ✗

Object 2 will be mod

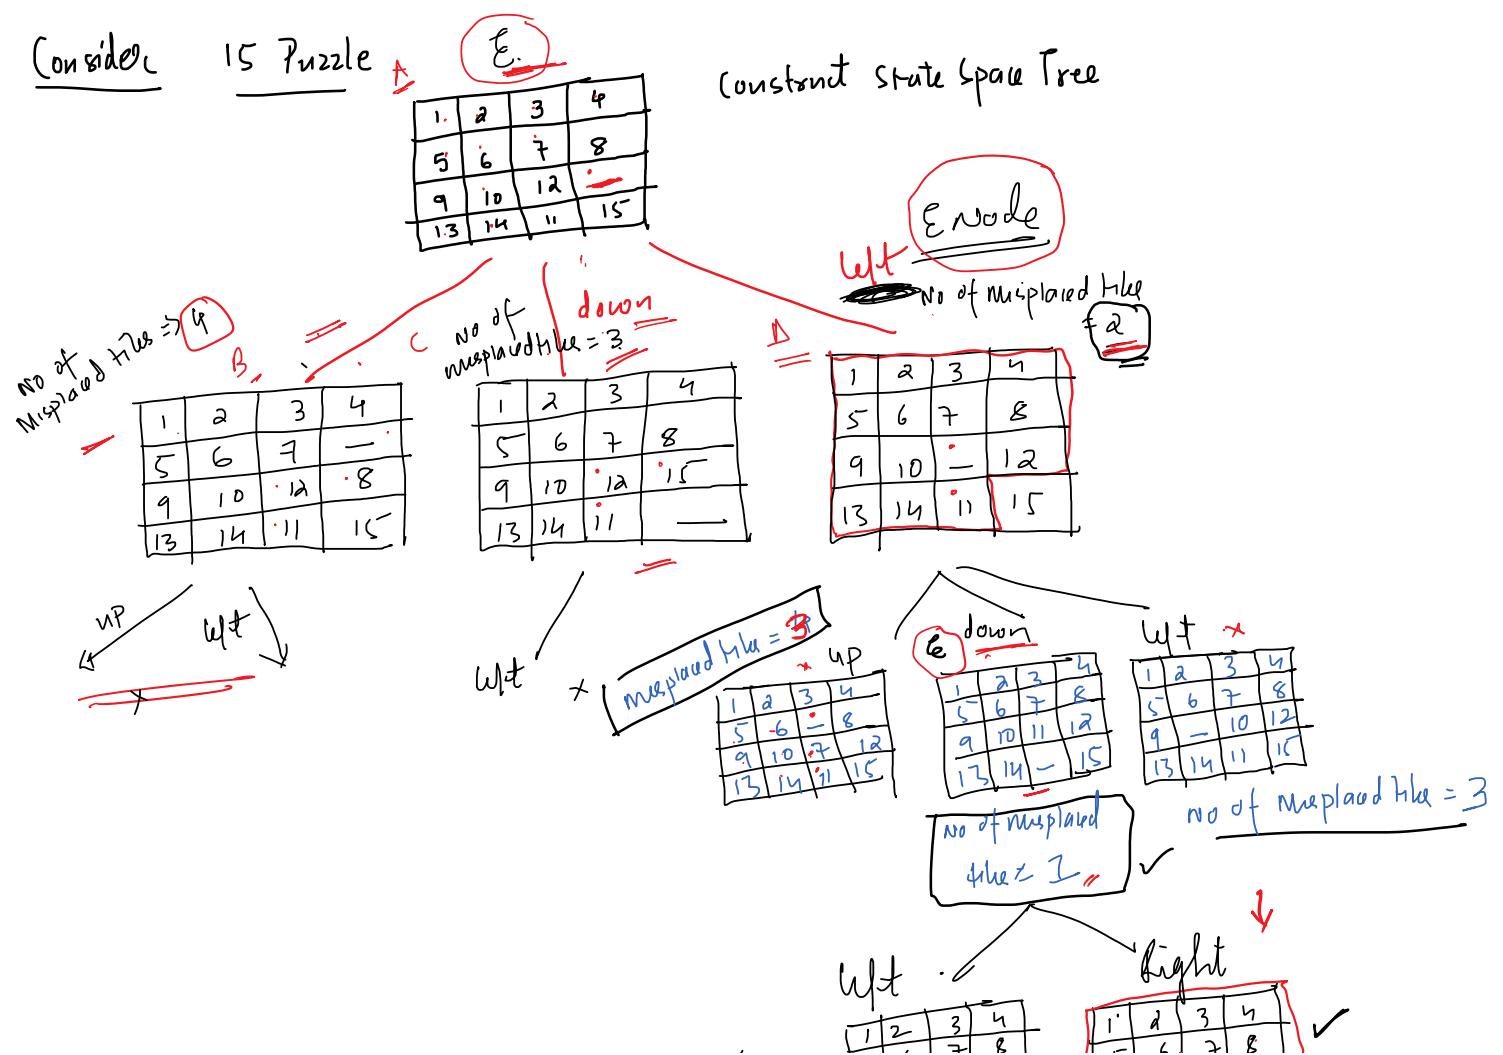

## Branch and Bound

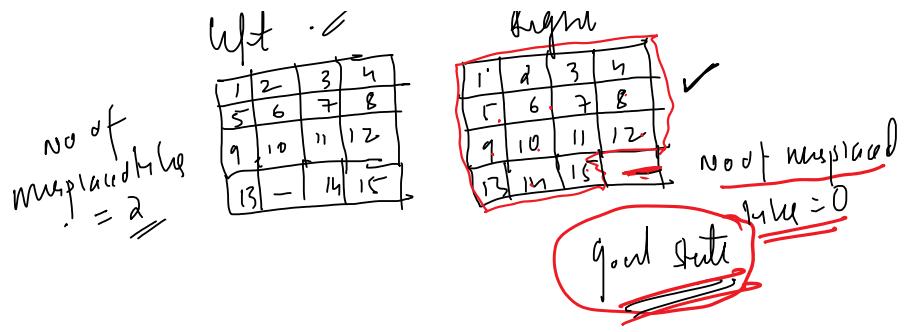

It is a technique of exploring a directed graph or State Space Tree

(No of Misplaced Tiles).

- \* In this we calculate bound on each node which represents the cost of reaching to goal (final) node from that node.
- \* If the solution represented by bound, is worst than best solution? found so far then that node is killed and corresponding branch is closed.
- \* The bound can also be used to select most promising node out of available.

Consider 15 Puzzle

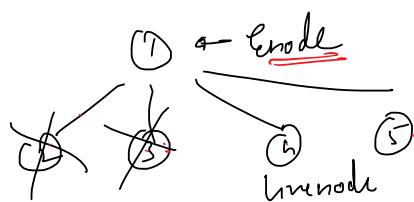

### Approach

- E-Node  $\Rightarrow$  It is a node that is currently getting expanded.
- Live Node  $\Rightarrow$  It's a node which is created but not expanded yet. In Branch and Bound at each E-node we find all the live nodes that can be generated using single step.

Those which are infeasible are killed and others are added to the list of live node.

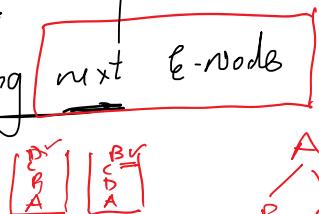

The following rules are followed in B & B  $\Rightarrow$

① All the children of current E-node are generated before selecting the next E-node.

② Each node may become an E-node exactly once.

③ Depending on policy of selecting next E-node B & B can be categorized as

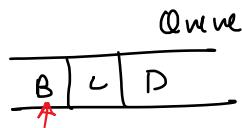

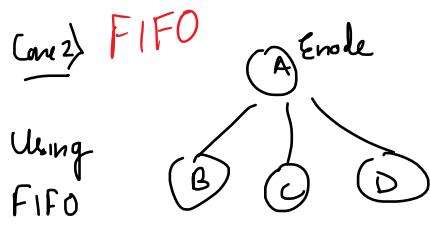

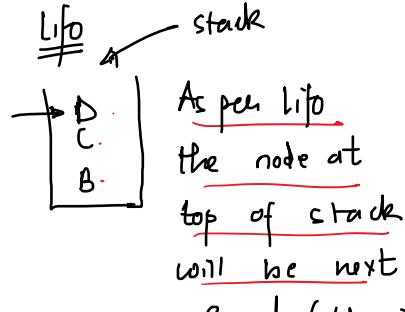

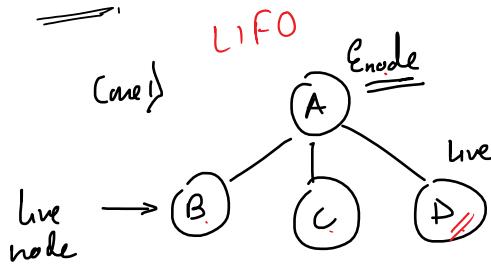

Ⓐ LIFO BB/LIFO Search  $\Rightarrow$  Here next E-node is selected using DFS.

B FIFO B.B / FIFO Search  $\Rightarrow$  Here next E-node  
 Queue is selected using BFS.

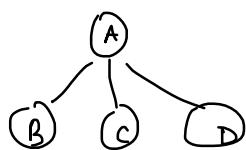

C L.C B.B / L.C Search [L.C = least cast] ✓  
 We use this in this next E-node is selected from the live node having least cast.  
 + L.C Search uses extended cast [^]

C(L.)

[But Both the above are not efficient]

We use least cast

$$\text{Next E-node cast} = \min(B, C, D)$$

$\Rightarrow$  It is intelligent methodology and is efficient

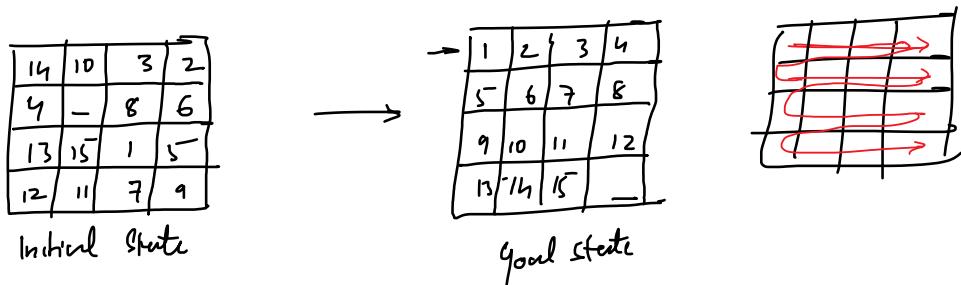

## # Puzzle Problem

In this we have a square block frame of  $4 \times 4$

dimension with 15 numbered tiles and an empty slot (ES)

The problem is to reach to goal state from

Initial State

- \* A legal move can be represented as movement of ES
- \* Here there are maximum 4 legal moves possible  
UP, DOWN, LEFT and RIGHT
- \* Hence we want to find set of legal moves to transform the initial state to goal state.
- \* A goal is reachable from initial state if and only if the initial state is reachable from goal state
- \* The Reachability can be as follows:

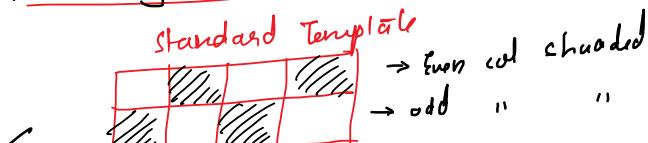

### Checking Reachability

The initial state is reachable from goal state if

$$\sum_{i=1}^{15} \text{less}(i) + X \text{ is } \underline{\text{Even}}$$

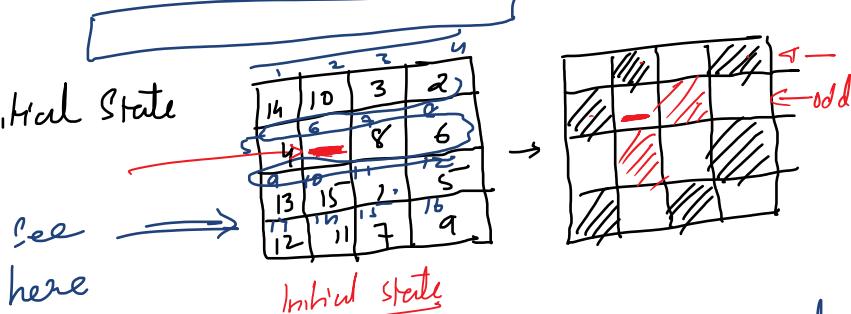

Here  $\boxed{\text{less}(i)}$  = No of tiles having value  $< \underline{i}$   
but they are ahead of it.

$\boxed{X}$  can be computed by comparing initial state with following board arrangement

✓  
 $x=1$  if ES in initial state matches with shaded slot  
 $x=0$  otherwise

Consider the Initial State

Here the ES in initial state does not matches with shaded slot.  
 So  $x=0$

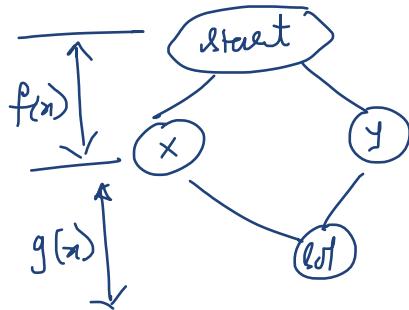

Now To calculate  $\sum_{i=1}^{15} \text{less}(i)$

$$\begin{array}{r}
 0 \\
 \hline
 1 & 0 \\
 \hline
 2 & 1 \\
 \hline
 3 & 2 \\
 \hline
 4 & 1 \\
 \hline
 5 & 0 \\
 \hline
 6 & 2 \\
 \hline
 7 & 0 \\
 \hline
 8 & 4 \\
 \hline
 9 & 0 \\
 \hline
 10 & 9 \\
 \hline
 11 & 2 \\
 \hline
 12 & 3 \\
 \hline
 13 & 6 \\
 \hline
 14 & 13 \\
 \hline
 15 & 6 \\
 \hline
 & 49
 \end{array}$$

$$\sum_{i=1}^{15} \text{loc}(i) + X = 49 + 0 = \underline{\underline{49}} \quad \text{Not Even}$$

The goal state here is not reachable

compute  $\hat{c}(x)$

$$\hat{c}(x) = \underline{\underline{f(x)}} + \underline{\underline{g(x)}}.$$

In 15 puzzle problem

$f(x)$  = depth of node  $x$ .

$g(x)$  = no of non blank tiles not in  
their goal state

## Travelling Salesman Problem Using Branch and Bound.

Approach → A better estimated cost function using  
"Reduced Cost Matrix"

[ \* A row of matrix is said to be reduced if it contains at least one zero and remaining elements are NonZero ]

$$\underline{Ex} \rightarrow \begin{bmatrix} 10 & 2 & 7 & \infty \end{bmatrix}$$

(To Reduce the row)  
↓  
 $\begin{bmatrix} 0 & 0 & 5 & \infty \end{bmatrix} \rightarrow \text{reduced row.}$

Similarly col can also be reduced.

\* A matrix is said to be reduced if all rows and all columns are reduced.

To find  $\hat{C}(n)$  ⇒ Cost to reach destination from current node  $\underline{n}$ .

Steps →

Step1) set all elements of  $i^{\text{th}}$  row and  $j^{\text{th}}$  col to  $\infty$

Step2) set  $A[j, i] = \infty$

Step3) Reduce all rows and col of resultant matrix.  
except the row & col containing  $\infty$

step 4) Compute the total reduction value

$$\underline{c^*(s)} = \underline{\hat{c}(R)} + \frac{\underline{A(i,j)}}{\text{cost of edge } i,j} + \frac{\gamma}{\text{total reduction value}}.$$

$\underline{s}$  will be child of  $\underline{R}$  from  $\underline{R \rightarrow s}$ .

$\underline{c^*}$  = current node edge from  $i$  to  $j$   
 $\underline{R} \Rightarrow$  from  $R$  to current node( $s$ ).

Dec-14 Consider

$$\begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \end{array} \left[ \begin{array}{cccc} \infty & 10 & 15 & 20 \\ 5 & \infty & 9 & 10 \\ 6 & 13 & \infty & 12 \\ 8 & 8 & 9 & \infty \end{array} \right]$$

Solve TSP using Branch and Bound.

Solution → Given Cost Matrix =

$$\left[ \begin{array}{cccc} \infty & 10 & 15 & 20 \\ 5 & \infty & 9 & 10 \\ 6 & 13 & \infty & 12 \\ 8 & 8 & 9 & \infty \end{array} \right]$$

(1)

To find  $\hat{C}(1) = \text{(cost to reach last node from node 1)}$ .  
→ go for Direct Reduction.

Since the tour starts from 1 so here there is no R

for Row Reduction → .

10 →	$\overline{\infty}$	10	15	20
5 →	5	$\overline{\infty}$	9	10
6 →	6	13	$\overline{\infty}$	12
8 →	8	8	9	$\overline{\infty}$

29

Total Row Reduction ⇒

$$\left[ \begin{array}{ccccc} \infty & 0 & 5 & 10 \\ 0 & \infty & 4 & 5 \\ 0 & 7 & \infty & 6 \\ 0 & 0 & 1 & \infty \\ 0 & 0 & 1 & 5 \end{array} \right]$$

Total Col Red

Now Col Reduction ⇒

$$\hat{C}(1) = \left[ \begin{array}{ccccc} 1 & \infty & 0 & 4 & 5 \\ 2 & 0 & \infty & 3 & 0 \\ 3 & 0 & 7 & \infty & 1 \\ 4 & 0 & 0 & 0 & \infty \end{array} \right]$$

Total Red ⇒  $29 + 6 = \underline{\underline{35}}$ .

step 2 → find  $\hat{c}^{\underline{(2)}}$  → cost of reaching "dest" node from node 2.

Here       $\begin{matrix} i & j \\ 1 & 2 \end{matrix}$

$\boxed{\ln \hat{c}^{\underline{(1)}}}$  → set  $\frac{1}{(i)}$  row to  $\infty$   
 set  $\hat{c}^{\underline{(j^m)}}$  col to  $\infty$

$$\text{Set } \underline{A(i,1)} \rightarrow \infty \quad \therefore \underline{A(2,1)} = \infty$$

	1	2	3	4
0 1	$\infty$	$\infty$	$\infty$	$\infty$
0 2	$\infty$	$\infty$	3	0
0 3	0	$\infty$	0	1
0 4	0	$\infty$	0	$\infty$
0	0	0	0	0

Row Red<sup>n</sup> ⇒ Total Row Red<sup>n</sup> ⇒ 0  
 Col Red<sup>n</sup> ⇒ Total Col Red<sup>n</sup> ⇒ 0

$$\underline{h_2 = 0}$$

$A(i,j)$  = cost of edge  $i \rightarrow j$ .  
 $A(1,2) = \ln \hat{c}^{\underline{(1)}} \text{ cost } 1 \rightarrow 2 = 0$

$$\begin{aligned} \underline{\hat{c}^{\underline{(2)}}} &= \hat{c}^{\underline{(1)}} + A(i,j) + \gamma : \text{Total Red}^n \text{ of } \hat{c}^{\underline{(2)}} \\ &= \underset{\substack{\text{Total Red}^n \\ \text{of } \hat{c}^{\underline{(1)}}}}{35} + 0 + 0 \\ &= 35 + 0 + 0 = \underline{\underline{35}} \end{aligned}$$

$\hat{c}^{\underline{(3)}}$  → cost to reach final node from node 3

$\begin{matrix} i & j \\ 1 & 3 \end{matrix}$

$\ln C^*(1) \rightarrow$  make  $i^{th} (1)$  row  $\Rightarrow \infty$   
 $j^{th} (3)$  col  $\Rightarrow \infty$

make  $(d, 1) = \infty$   
 $(3, 1) \Rightarrow 0$

$$\therefore C^*(3) = \begin{bmatrix} 0 & \infty & \infty & \infty & 0 \\ 0 & 0 & \infty & \infty & 0 \\ 1 & \infty & 0 & \infty & 1 \\ 0 & 0 & 0 & \infty & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Row Red<sup>h</sup>  $\rightarrow$  Total Row Red<sup>h</sup> = 1

$$\begin{bmatrix} \infty & \infty & \infty & \infty & 0 \\ 0 & \infty & \infty & 0 & 0 \\ \infty & 0 & \infty & 0 & 0 \\ 0 & 0 & \infty & \infty & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Col Red<sup>h</sup>  $\Rightarrow 0$

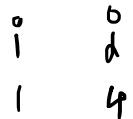

Total Red<sup>h</sup> = 2 = 1 + 0 = 1.

$A(i, j) = \ln C^*(1) = (1, 3) = 4$

$$\therefore C^*(3) = C^*(1) + A(1, 3) + 4$$

$$35 + 4 + 1 = \underline{\underline{40}}$$

$C^*(4)$  = Cost of reaching destination from node 4

$\ln C^*(1)$  make  $i^{th}$  row  $\Rightarrow$  1<sup>st</sup> row to  $\infty$   
 $j^{th}$  col  $\Rightarrow$  4<sup>th</sup> col to  $\infty$

also  $(d, 1) = (4, 1) \rightarrow \infty$

also  $(d_{i,j}) = (4,1) \rightarrow \infty$

$$\begin{matrix} 0 & \infty & \infty & \infty \\ 0 & 0 & \infty & 3 & \infty \\ 0 & 0 & 7 & \infty & 10 \\ 0 & \infty & 0 & 0 & \infty \end{matrix}$$

$$\frac{0}{\infty} \quad \frac{0}{0} \quad \frac{0}{0} \quad \frac{0}{0}$$

Row Red<sup>n</sup>  $\Rightarrow 0$

Col Red  $\Rightarrow 0$  Total Red<sup>n</sup> = 0.

$$\ln c(1) \quad (0,1) = (1,4) \Rightarrow 5$$

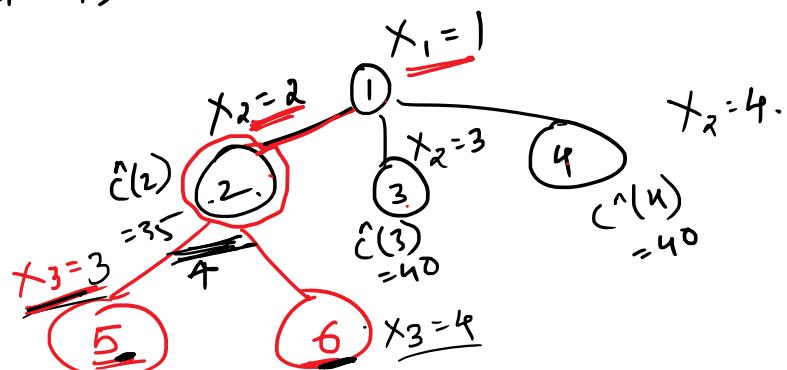

$$\begin{aligned} \therefore \hat{c}(n) &= \hat{c}(1) + A(1,1) + b \\ &= 35 + 5 + 0 = 40. \end{aligned}$$

Now  $c(2) = \text{cost to dist}^n \text{ from } d \rightarrow \text{visiting } d \text{ from } 1 \Rightarrow 35$

$$c(3) = \text{ " " " " } 3 \rightarrow \text{ " } 3 \text{ " " } \Rightarrow 40$$

$$c(4) = \text{ " " " " } 4 \rightarrow \text{ " } 4 \text{ " " } \Rightarrow 40.$$

Least cost is  $c(2)$  re In SSSP we will visit node  $d$ .

Step 3 Now we visited from vertex 1 to vertex 2

Now at vertex 2 i.e  $c(2)$  we have options to

visit vertex 3  $\Rightarrow c(5)$

or visit vertex 4  $\Rightarrow c(6)$

$\hat{c}(5) = \text{from node } 2 \text{ to } 3$

In  $\hat{c}(2)$   $\Rightarrow$  make  $i^{th}$  row  $\Rightarrow \infty$   
 make  $(2)$   
 make  $j^{th}$  col  $\Rightarrow \infty$   
 $(j, i) = (3, 1) = \infty$

$$\begin{array}{c} 0 \\ 0 \\ -1 \\ 0 \\ \Rightarrow 1 \end{array} \left[ \begin{array}{ccccc} 0 & \infty & \infty & \infty \\ \infty & \infty & \infty & \infty \\ \infty & 0 & \infty & -1 \\ 0 & \infty & \infty & \infty \\ 0 & 0 & 0 & \infty \end{array} \right]$$

Total Row Red<sup>n</sup> = 1

$$\left[ \begin{array}{ccccc} \infty & \infty & \infty & \infty \\ \infty & \infty & \infty & \infty \\ \infty & \infty & \infty & 0 \\ 0 & \infty & \infty & \infty \\ 0 & 0 & 0 & 0 \end{array} \right]$$

Col<sup>n</sup> Red<sup>n</sup> = 0

Total Red<sup>n</sup> =  $1 + 0 = 1$        $\lambda = 1$

In  $\hat{c}(2) \Rightarrow (2, 3) \Rightarrow 3$

$$\begin{aligned} \hat{c}(5) &= \hat{c}(2) + (2, 3) + 1 \\ &= 35 + 3 + 1 = \underline{\underline{39}}. \end{aligned}$$

Now  $\hat{c}(6) = \text{In Tree from node } 2 \text{ to } 6$

$$\Rightarrow \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \end{array}$$

In  $\hat{c}(2)$  Make  $2^{nd}$  row  $= \infty$   
 $4^{th}$  col  $= \infty$

$$\text{make } (4, 1) = \infty$$

$$\dots \left[ \begin{array}{cccc} 0 & \infty & \infty & \infty \\ 0 & \infty & \infty & \infty \\ 0 & 0 & \infty & \infty \\ 0 & 0 & 0 & \infty \end{array} \right] )$$

$$\text{max} -$$

$$\hat{c}(6) \Rightarrow \begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad \left. \right\}$$

Row "0"  $\Rightarrow 0$

Col Row "0"  $\Rightarrow 0$

$$x_1 = 0 + 0 = 0$$

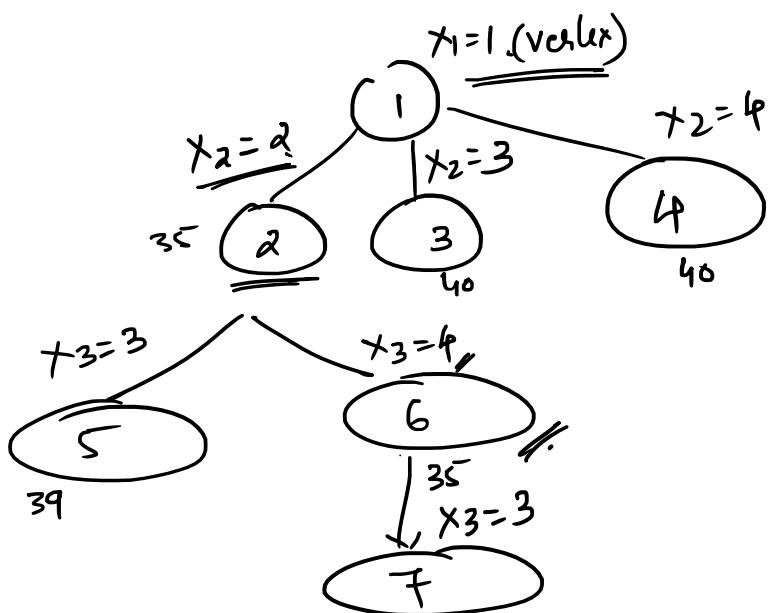

$$\ln c(2) = (2, 4) = 0$$

$$\hat{c}(6) = \hat{c}(2) + (2, 4) + 0 = 35$$

From node 2 in Tree

- vertex 3  $\rightarrow$  node 5 of tree  $\Rightarrow 39$
- vertex 4  $\rightarrow$  node 6 of tree  $= 35$

We will visit vertex 4 from vertex 2.

Now at vertex 4  $\Rightarrow$  only option is vertex 3

From  $\hat{c}(6)$

$$\begin{array}{c} 0 \\ 4 \\ 3 \end{array}$$

$$\hat{c}(7) = \cancel{4}$$

$$\ln \hat{c}^n(6) \quad \begin{matrix} 4^{\text{th}} \\ \text{row} \end{matrix} \quad \begin{matrix} \text{row} = \infty \\ \text{col} = \infty \end{matrix}$$

$$(3,1) \rightarrow \infty$$

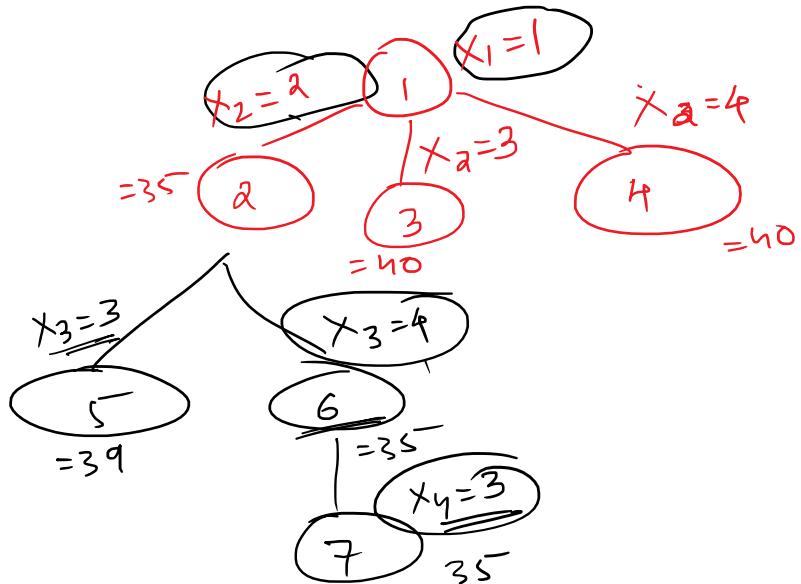

$$\begin{bmatrix} 10 & \infty & 10 & \infty \\ \infty & \infty & 10 & \infty \\ 10 & \infty & 10 & \infty \\ \infty & \infty & \infty & \infty \end{bmatrix}$$

$$\text{Row Red} = 0$$

$$\text{Col Red} = 0$$

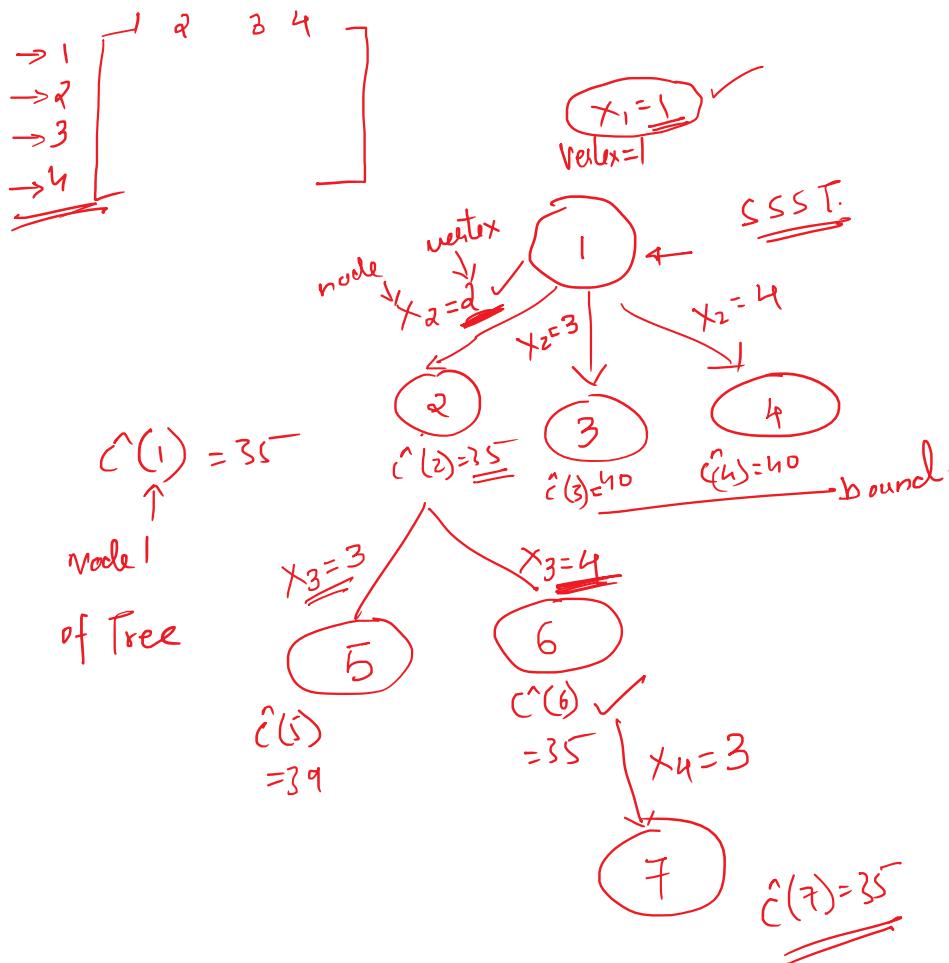

$$d_i = 0 + 0 = 0$$

$$\begin{aligned} \underline{\hat{c}^n(7)} &= \underline{\hat{c}^n(6)} + \underline{(4,3)} + d_i \\ &= 35 + 0 + 0 = \underline{\underline{35}} \end{aligned}$$

$$\text{Path} = \frac{1 - 2}{10} \rightarrow \frac{4}{10} \rightarrow \frac{3}{9} \rightarrow \frac{1}{6} = \underline{\underline{35}}$$

$$\hat{c}^n(7) = \underline{\underline{35}}$$

Trick  $\hat{C}(1) \rightarrow$  only row & col<sup>n</sup> Reduction.

Refer  $\hat{C}(1)$

$\hat{C}(2) = \text{from } i \text{ to } j$        $i^{\text{th}} \text{ row} = \infty$   
 $\hat{C}(3) = \text{from } i \text{ to } j$        $j^{\text{th}} \text{ col} = \infty$   
 $\hat{C}(n) = \text{from } i \text{ to } j$        $[i, j] = \infty$

$\hat{C}(2) = \hat{C}(1) + (i, j) + \infty$   
 $\hat{C}(3) = \hat{C}(1) + (i, j) + \infty$   
 $\hat{C}(4) = \hat{C}(1) + (i, j) + \infty$

Refer  $(i, j)$  in  $\hat{C}(1)$

How we selected  $\hat{C}(2)$  as it was least cost

Now 1-2 done we need to decide from  $2 \begin{matrix} 3 \\ 4 \end{matrix}$

Now  $i=2$  done we need to decide from  $a \xrightarrow{i} 4$

$$\left\{ \begin{array}{l}
 \hat{c}(5) = \text{from } \overset{0}{i} \text{ to } \overset{0}{d} \\
 \hat{c}(6) = \text{from } \overset{0}{i} \text{ to } \overset{0}{d} \\
 \end{array} \right. \quad \left\{ \begin{array}{l}
 \text{1st row, } \overset{0}{j} \text{ th col} = 0 \\
 [d, 1] = \infty
 \end{array} \right. \quad \left\{ \begin{array}{l}
 \hat{c}(5) = \hat{c}(2) + (i, j) + r \\
 \hat{c}(6) = \hat{c}(2) + (i, j) + r \\
 \text{Refer } (i, j) \text{ in } \underline{\hat{c}(2)}
 \end{array} \right.$$

Here we select  $\hat{c}(6) = 35$  as least cost

so up till now  $1 \rightarrow 2 \rightarrow 4$ , Now we are at 4<sup>th</sup> vertex

from 4 will visit 3 only.

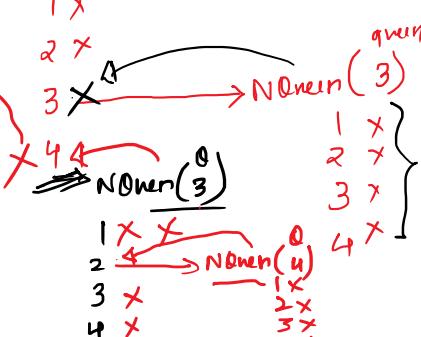

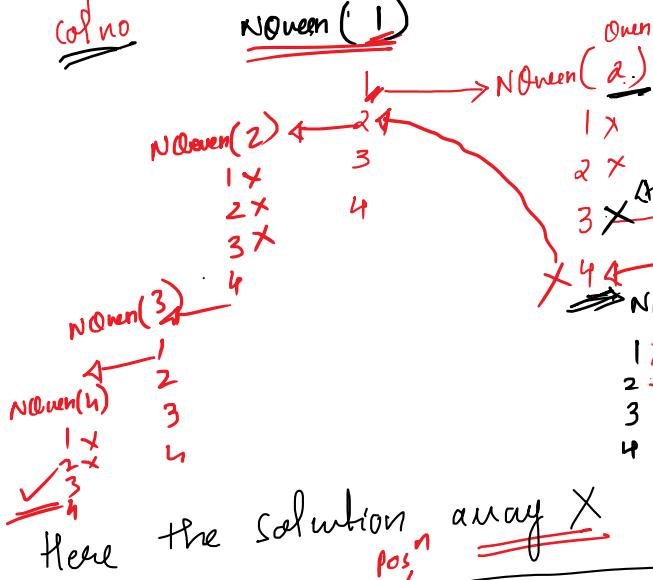

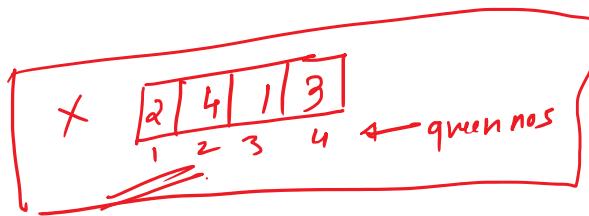

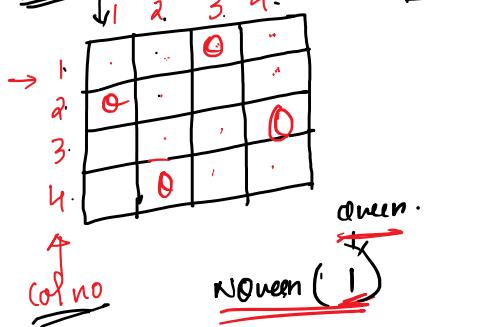

$$\left\{ \begin{array}{l}
 \text{Refer } \hat{c}(6) \\
 \hat{c}(7) = \text{from } \overset{0}{i} \text{ to } \overset{0}{d} \\
 \end{array} \right. \quad \left\{ \begin{array}{l}
 \text{1st row, } \overset{0}{j} \text{ th col} = 0 \\
 [d, 1] = \infty
 \end{array} \right.$$

## Backtracking Approach $\Rightarrow$

N Queen Problem  $\rightarrow$

Given:  $\begin{cases} N \times N \text{ chessboard} \\ N \text{ Queen} \\ [\text{none of the queens are attacking position}] \end{cases}$

4-Queen.  $N=4$

the solution array  $X$  contains the solution

Here  $X[0]$  gives column position of queen  $\begin{array}{c} 0 \\ \hline 1 \end{array}$

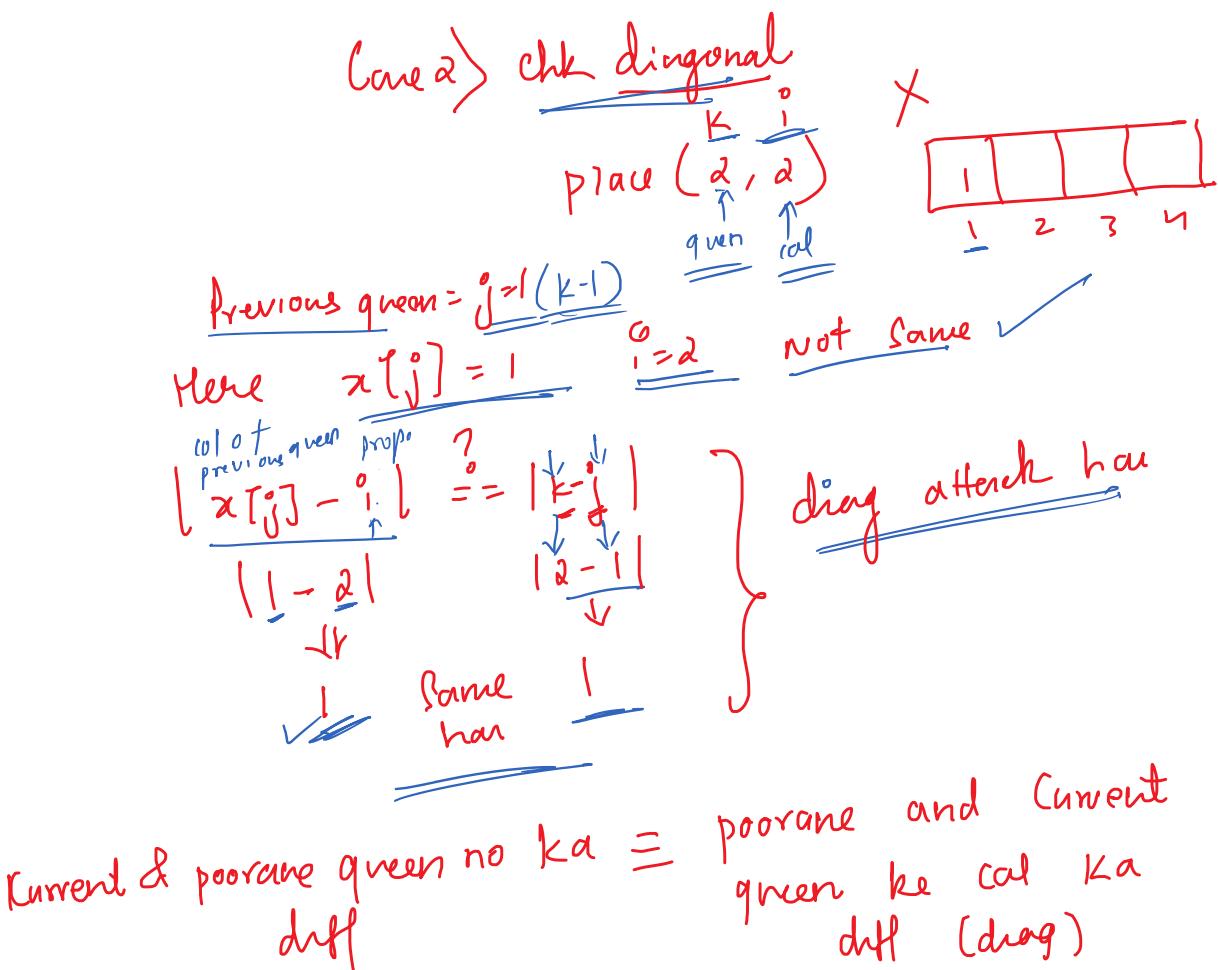

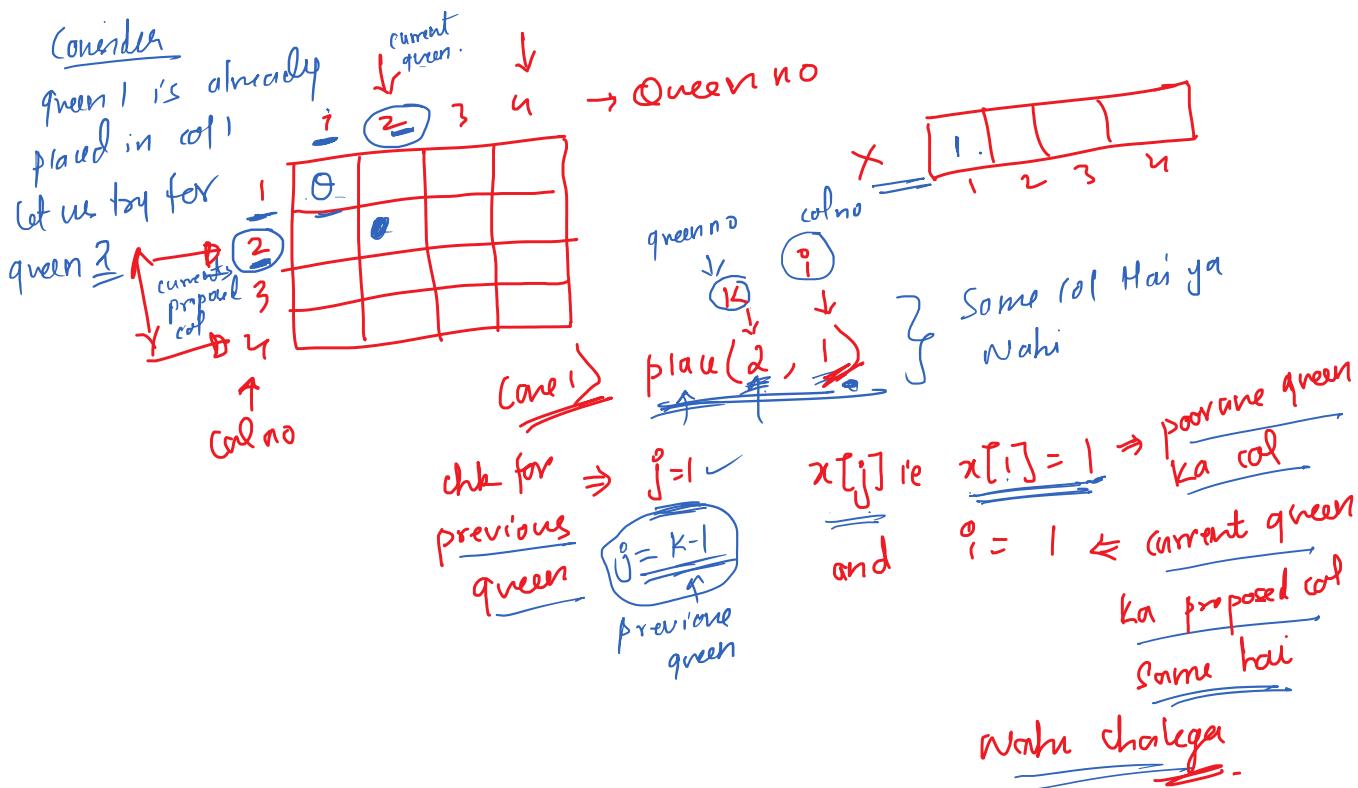

$X = [2 | 4 | 1 | 3] \leftarrow$  solution array  $X$

① Every value in array  $X$  must be unique

[Every queen must be placed at diff col<sup>n</sup>]

② Every value must be  $\dots$

between 1 to n (inclusive)

$$\dots 2 \dots \dots (K \quad i)$$

Case 3  $\Rightarrow$  place  $(\begin{smallmatrix} K & i \\ \geq & 3 \end{smallmatrix})$

① chk for same col  $\rightarrow j = k-1$

$$x[j] = x[i] = 1$$

poorane green  
Ka Allotted  
col

$i=3$   
current green  
Ka proposed  
col

$\left. \begin{array}{l} \text{Same} \\ \text{Nahi Hua} \end{array} \right\} \Rightarrow$

② chk diag

$$\left| \begin{matrix} 1 & - & 3 \\ x[j] & - & i \end{matrix} \right| = 2 //$$

poorane  
green ka col  
col

poorane  
green  
Ka proposed  
col

$$\left| \begin{matrix} 2 & - & 1 \\ K & - & j \\ \uparrow & & \uparrow \\ \text{current} & & \text{poorane} \\ \text{green} & & \text{green} \end{matrix} \right|$$

$\geq 1$

Above ~~not~~ Not Same

So  $K^{\text{th}}$  green can be placed at  $i^{\text{th}}$  col.

# BACKTRACKING

Date \_\_\_\_\_  
Page \_\_\_\_\_

## \* Backtracking :

- It is a method of solving a problem (Eg. N Queen)
- The principle idea is to construct solutions by taking one component at a time. The component is added in the solution if all the constraints in the problem definition are satisfied.
- If constraints are not satisfied then the latest component is dropped from the solution.  
i.e. while finding the solution to the problem, we find some partial solution. step 1, step 2, ... step K
- At step K+1, the program discovers that it cannot go further with the solution due to some mistake in the previous step in such situation the program can be made to backtrack and repair the previous step solution.

## \* N-QUEEN PROBLEM :

- n x n chess board and given n queen.  
We want to place all the n queen on the board in non-attacking position.

Note: Queen can attack horizontally, vertically & diagonally.

1	2	3	X = 4
2	1	3	

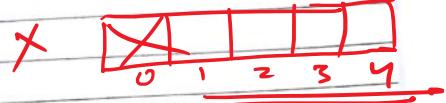

- Solution can be found using 1-D array of 'n' elements.
- K<sup>th</sup> element of array X will give column of K<sup>th</sup> queen.
- The constraints on array X are every value stored in arr. X should be unique.
- Every value stored in array X should be between 1 to n.

## for N Queen

1. Let  $n$  be number of queens ✓
2. Let  $x[n+1]$  be array that stores column of queen .  $n=4$

Algo for function `read()`

- i. Accept no. of queens. i.e.  $n$  ✓
- ii. Create array  $x$  of  $n+1$  elements .

Algo for function `place(k, i)`

It indicates whether  $k$ th queen can be placed in  $i$ th column .

`int place(int k, int i)`

{      queenNo      col

    int j ;      // j refers to previous queens .

    for (j=1 ; j <= k-1 ; j++)

    {

        if ((x[j] == i) || (|x[j]-i| == (k-j)))

            return 0;

        queen ke

        col ka

        diff

        queen ke

        diff

    }

    return 1 ;

}

Algo for function `nqueen(int k)`

`void nqueen(int k)`

{

    for (i=1 ; i <= n ; i++) → for all n col

{

        if (place(k, i)) Yes

{

            x[k] = i ; // place kingo

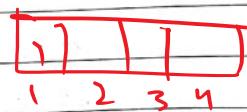

N queen b)

1 -

2 -

3 -

4 -

    if it → if (k == n) // To point solution .  
last queen {      for (j=1 ; j <= n ; j++) } print X array .  
    {      for (j=1 ; j <= n ; j++) } print x[j];

else  
 $nqueen(k+1); \rightarrow$  agar queen no n nahi hua (last queen  
 nahi hua)  
 } // end of if      ↗ call for next queen.  
 } // for ends  
 } // end of nqueen.

### in place function -

NOTE:

- $j$  refers to previous queens.
- $x[j]$  : column of previous queen  $j$ .  $i$  = proposed col of current queen.
- $i$  : proposed column of current queen  $k$
- $|x[j]-i|$  : difference in column of previous & current queen.
- $(k-j)$  : difference in queen number.

$k$  = current queen

$i$  = proposed col of current queen.

if  $((x[i] == i) \text{ || } (|x[j]-i| == (k-j)))$

### PROGRAM :

```
# include < stdio.h>
int n, x[16]= {0};
int place (int k, int i)
{
    int j;
    for (j=1; j<=k-1; j++)
        if ((x[j]==i) || (abs(x[j]-i)==(k-j)))
            return 0;
    return 1;
}
```

```
void nqueen (int k)
{
    int i,j;
    for (i=1; i<=n; i++)
        if (place (k, i))
        {
            x [k]=i;
            if (k==n)
            {
                for (j=1; j<=n; j++)
                    printf ("%d ", x[j]);
                printf ("\n");
            }
            else nqueen (k+1);
        }
}
```

```
void main()
{
    printf ("enter the number of queens\n");
    scanf ("%d", &n);
    printf ("All possible solutions are :\n");
    nqueen (1);
}
```

### \* GRAPH COLOURING PROBLEM :

- Given a graph of ' $v$ ' vertices and ' $e$ ' edges and ' $n$ ' different colours.
- We want to colour the graph with  $n$  colours in such a way that the adjacent vertices must not be of same colour.
- A graph is said to be ' $m$ ' colourable graph, if ' $m$ ' is the minimum no. of colour necessarily to colour all the vertices ensuring adjacent vertices are not of same colour.
- Consider a graph :

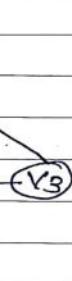

Problem?  
Agar ek graph hain  
to minimum kitne color  
ke liye padhega to ensure  
ke kuch vertex aur of same color

We know the above graph is 3 colourable graph. Let, the colours be 1, 2 & 3.

- possible solutions are :

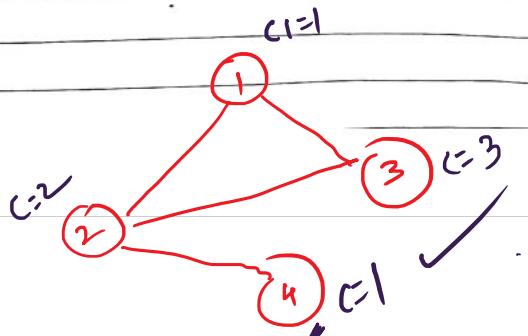

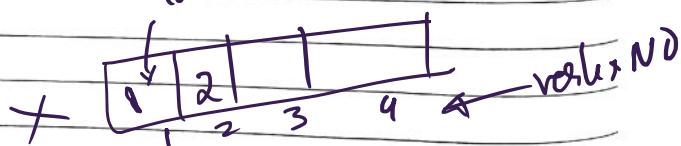

$V_1$	$V_2$	$V_3$	$V_4$
1	2	3 ✓	1 ✓
1	2	3	3
3	2	1	3
3	2	1	1
:			

Here if we take 4 colors  
It's feasible as all vertex  
will be of diff col or but  
not optimal because  
4 is minimal value.

M = 3

color no

solution :

Consider 1-D array  $x$  that has  $V$  elements where every element in  $x$  store color number.

No of  
↓ vertex

$x[i] = \text{color NO}$   
 $g = \text{vertex NO}$

constraint on array  $x$ :

- (1) If  $i$  and  $j$  are adjacent vertices then  $x[i] \neq x[j]$
- (2) Every value in  $x$  must be between 1 to  $n$

Algorithm :

Let  $g$  represents adjacency matrix of graph with  $V$  vertices and  $E$  edges

Let int  $x[V]$  stores solution.

Algo for color()

[ $k^{th}$  vertex pe  $i^{th}$  color chalega kya ? ]

int color (int  $K$ , int  $i$ )

{      Vertex No      Col No

    int  $j$  : for all proximate vertex

    for ( $j=1$  ;  $j <= K-1$  ;  $j++$ )

    {      adjacent Hai

        if ( $g[K][j] \neq 0$  &&  $x[j] == i$ )

            return 0;

    }

    return 1;

}

current

$k$ : vertex number.

$i$  : colour numbers (imposed Color Number)

$g[K][j] \neq 0$  :  $k^{th}$  vertex aur  $j^{th}$  vertex adjacent hai kya

$x[j] == i$  :  $j^{th}$  vertex ka proposed color

parann

$\downarrow$   
 $j^{th}$  colour of vertex  $j$

$\downarrow$   
proposed colour of  $k^{th}$  vertex

```

Algo. for graphcolor()
void graphcolor (int K)
{
    int i;
    for(i=1; i<=n; i++)
        {
            if (color (K,i))
                {
                    z[K] = i;
                    if (K==r)
                        {
                            for(j=1 to r)
                                print z[j];
                            // Solution.
                        }
                    else graphcolor (K+1);
                }
        }
}

```

↑ vertex no  
↑ check for all possible n colors  
↑ agar vertex K ko color i se color kar sakte hai  
↑ kya ye last vertex No hai  
↑ call for next vertex .

### \* SUM OF SUBSET $\Rightarrow$

Problem statement:

We are given 'n' positive integers and a positive integer and a number 's'.

We have to find all possible subset of 'n' such that their sum is 's'.

$$\begin{aligned}
 \rightarrow N &= \{1, 2, 3, 10, 12, 13, 15\} && \text{Here } n=7 \\
 \rightarrow s &= 15. \\
 \text{Sum req.} & \\
 \{15\} &\checkmark \\
 \{2, 3, 10\} &\checkmark \\
 \{3, 12\} &\checkmark
 \end{aligned}$$

Possible solutions are:

$$X = \{1, 5\} \text{ EN}$$

$$X = \{2, 13\} \text{ EN}$$

$$X = \{3, 12\} \text{ EN}$$

$$X = \{1, 2, 12\} \text{ EN}$$

$$X = \{2, 3, 10\} \text{ EN}$$

⋮

The solution for the problem can be found using Backtracking approach. Let there be 1-D array  $X$  that has  $n$  locations. The array  $X$  will store those integers whose sum will be  $s$ .

~~Constrains on array  $X[]$  are:~~

Equal to  $s$ .

1. Sum of elements in array  $X$  should not exceed  $s$ .
2. The values stored in array  $X$  should be unique as we do not want to repeat the subset.

Program :

```
#include <stdio.h>
#include <conio.h>
void sumset(int);
void proper(int, int);
int sum(int)
```

```
int v[10]; // To store elements
int x[10]; // To store solution.
int n, sumreq;
```

scanf("%d", &n);

```

void main()
{
    int i;
    clrscr();
    printf("Enter number of elements\n");
    scanf("%d", &n);
    printf("Enter unique elements in increasing order\n");
    for(i=1; i<=n; i++)
        scanf("%d", &v[i]);
}

printf("Enter sum required\n");
scanf("%d", &sumreq);
sumset();
getch();
}

int sum (int n) // gives sum of first n elements
{
    int s, i;
    s=0;
    for (i=1; i<=n; i++)
        s = s + x[i];
    return s;
}

int proper (int k, int i)
{
    int j;
    for(j=1; j<=k-1; j++) // If same element is present before
        if (x[j]==v[i]) // Repeated toh nahi
            return 0;
}

```

$v = \boxed{1 \mid 2 \mid 3 \mid 10 \mid 12 \mid 13 \mid 15}$   
 $x = \boxed{\quad \quad \quad}$   
 ↑      ↑      ↑      ↑      ↑      ↑      ↑      ↑      ↑      ↑      ↑

↑ Array x main  $K^{th}$  pos par array v ka  $i^{th}$  pos  
 ka element daukha lya .

```
if ((sum(k-1) + v[i]) > sumreq) // previous kth element  
    return 0;  
else return 1;
```

}

```
int sumset (int k)
```

{

```
    int i, s, j;
```

```
    for (i=k; i<=n; i++)
```

{

```
    if (proper(k, i))
```

{

```
        x[k] = v[i];
```

```
        s = sum(k);
```

```
        if (s == sumreq)
```

{

```
            for (j=i; j<=k; j++)
```

```
                printf("%d", x[j]);
```

// Print solution

}

```
        else
```

```
            sumset(k+1);
```

}

}

**NOTE:**

k is position in array x.

i is position in array v.

proper() specifies whether element at i<sup>th</sup> element position  
can be placed at k<sup>th</sup> position in array x.

Possible solutions are:

$$X = \{1, 5\} \text{ EN}$$

$$X = \{2, 13\} \text{ EN}$$

$$X = \{3, 12\} \text{ EN}$$

$$X = \{1, 2, 12\} \text{ EN}$$

$$X = \{2, 3, 10\} \text{ EN}$$

⋮

The solution for the problem can be found using Backtracking approach. Let there be 1-D array  $X$  that has  $n$  locations. The array  $X$  will store those integers whose sum will be  $s$ .

Constrains on array  $X[]$  are :

Equal to  $s$ .

1. Sum of elements in array  $X$  should not exceed  $s$ .

 $i=2$        $j=2$        $P[4]=T[0+4]$        $P[5]=T[0+5]$

## ② Knuth Morris Pratt (KMP) Pattern matching

Here, we study the pattern so we reduce the time needed. and it is not require backtrack again & again. The idea of KMP is to find within string if any prefix same as suffix. i.e. if the beginning part of the pattern appears

again in pattern. So for this we generate  $\pi$ -table or LPS (longest prefix for that some suffix)

Note:- We need to study the pattern  $P$  & toy to find it start position of pattern is repeated in latter part.

	1	2	3	4	5	6
Pattern	a	b	c	d	a	b
$\pi$ -table	0	0	0	0	1	2

a	b	c	d	a	b	e	a	b	f
$\pi$ -table	0	0	0	0	1	2	0	1	2

a	b	c	d	e	a	b	f	a	b	c
$\pi$ -table	0	0	0	0	0	1	2	0	1	2

a	a	b	c	a	d	a	a	b	e
$\pi$ -table	0	1	0	0	1	0	1	2	3

a	a	a	a	b	a	a	c	d
$\pi$ -table	0	1	2	3	0	1	2	0

Algo to prepare  $\pi$ -table for given pattern  $P$

KMP-failure ( $P$ )

$$\begin{aligned} P(1:m) &= \text{Pattern} \\ f(1:m) & \end{aligned}$$

1. start
2.  $f(0) = 0, i = 1, j = 0$
3. while ( $i < m$ ) do
  4. if  $p(j) = p(i)$  then
    5.  $f(i) = j + 1$
    6.  $i = i + 1, j = j + 1$
  7. else if ( $j > 0$ ) then
    8.  $j = f(j - 1)$
  9. else
    10.  $f(i) = 0$
  11.  $i = i + 1;$
12. return

Consider,

$P = \begin{matrix} 0 & 1 & 2 & 3 & 4 & 5 \\ a & b & a & c & a & b \end{matrix}$  length  $m = 6$

$i$	$j$	$f(0)$	$f(1)$	$f(2)$	$f(3)$	$f(4)$	$f(5)$
1	0	0	0				
2	0			1			
3	1				0		
4	0					1	
5	1						2
6	2						

```

function KMP_match(T, P)
    T(1:n), P(1:m)
    Integer f(1:m)

```

1. start

2. i = 0    j = 0

3. while (i < n) do

{

    if (P(j) == T(i)) then

        if (j == m - 1) then

            return i - m + 1

        else

            i = i + 1    j = j + 1

}

    else if (j > 0) then    j = f(j - 1)

    else    i = i + 1

}

Consider

$P = \begin{matrix} a & b & a & c & a & b \\ \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & \downarrow \\ j & & & & & \end{matrix}$

$T = \begin{matrix} a & b & a & c & b & a & b & a & c & a & b \\ \downarrow & \downarrow \\ i & i & i & i & i & i & i & i & i & i & i \end{matrix}$

$f = \begin{bmatrix} 0 & 1 & 2 & 3 & 4 & 5 \\ 0 & 0 & 1 & 0 & 1 & 2 \end{bmatrix}$

At    i = 4    &    j = 4    ,     $P(j) \neq T(i)$

∴ put j to     $f(j - 1)$

Here     $f(4 - 1) = f(3) = 0$

∴    j = 0

Hindi main :-

i & j ko 0 se start karo  
Jab tak ( $P(j) == T(i)$ )  
i++ , j++

Agar  $j = m-1$  (last character)  
mila at  $i-m+1$

Agar  $[P(j) != T(i)]$  to j ko piceko le jaao  
kahan  $j = f(j-1)$

Agar j already 0 hai toh i ko agge le  
jaao  $i = i+1$

T = a b a b c a b c a b a q b a b d

P = a b a b d

f = 0 0 1 2 0

### 3) Robin Karp:

- It finds a pattern within a text using hashing
- It is used for finding multiple occurrence of the pattern in the text

#### Algorithm:-

fn RobinKarp (Txt, pat, d, q)

Txt (1:n)  $\rightarrow$  text

pat (1:m)  $\rightarrow$  pattern

d  $\rightarrow$  length of i/p alphaset ( $d = 256$ )

q  $\rightarrow$  prime number

```

1. Start
2. p = 0 , t = 0
3. h =  $d^{m-1} \text{ mod } q$ 
4. for i = 0 to m-1 do
   {
5.   p = (d * p + Pat(i)) mod q
6.   t = (d * t + Txt(i)) mod q
   }
7. for i = 0 to n-m do
   {
8.   if p = t then
   {
9.     for j = 0 to m-1 do
   {
10.    if Txt(i+j) ≠ Pat(j) then
11.      go to step 12
   }
12.    if j = m then
13.      print "Pattern found at ", i
   }
14. if i < n-m then
   {
15.   t = [d * (t - Txt(i) * h) + Txt(i+m)] mod q
16.   if t < 0 then
17.     t = t + q
   }
18. return

```

$$\begin{array}{cccc} a & b & c & d \\ 92 & 98 & 99 & \textcircled{100} \end{array}$$

# KMP (Knuth Morris Pratt) Algorithm for

Pattern      Matching

## Basic Idea of working

Pattern  $\Rightarrow$   $a \overset{1}{b} \overset{2}{c} \overset{3}{d} \overset{4}{a} \overset{5}{b} \overset{6}{c} \overset{7}{d}$

Prefix  $\Rightarrow$   $a, ab, \underline{\underline{abc}}, abc\overset{1}{d}, abc\overset{2}{d}a, abc\overset{3}{d}ab, \underline{\underline{\underline{abcd}}}$   
Pattern  
(from start)

Suffix  $\Rightarrow$   $c, bc, \underline{\underline{abc}}, dabc, cdabc, bcdabc, \underline{\underline{\underline{abcdabc}}}$   
(subset from  
(last))

The basic idea of KMP is ^ Inside a string is any Prefix Same as Suffix

[ KMP will if pattern from beginning of Text appears.  
again in the end ]  
prefix

Here we generate  $\pi$  table to get LPS (longest prefix which is same as suffix)

Consider  $P_1 = a \overset{1}{b} \overset{2}{c} \overset{3}{d} \overset{4}{a} \overset{5}{b} \overset{6}{c} \overset{7}{d} \overset{8}{e} \overset{9}{f}$   
 $\pi = 0 \ 0 \ 0 \ 0 \ 1 \ 2 \ 0 \ 1 \ 2$

$$\pi = \begin{array}{ccccccc} & 0 & 0 & 0 & 0 & 0 & 0 \\ \hline P_2 = & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 \\ & a & b & c & d & e & a & b & f & a & b & c \\ \pi = & 0 & 0 & 0 & 0 & 0 & 1 & 2 & 0 & 1 & 2 & 3 \end{array}$$

$$P_3 = \begin{array}{ccccccccc} & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 \\ & a & a & b & c & a & d & a & a & b & c \\ \hline \pi & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 2 & 3 & 0 \end{array}$$

Consider an example to find occurrence of  $P$  in  $T \Rightarrow$

$$T = \begin{array}{cccccccccccccc} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 \\ a & b & a & b & c & a & b & c & a & b & a & b & a & b & d \end{array}$$

$$P = \begin{array}{cccc} 1 & 2 & 3 & 4 \\ a & b & a & b \end{array}$$

Let  $i$  starts at posn 1 in  $T$

Let  $j$  starts at pos 0 in  $P$  (will make simple)

KMP Approach → Compare  $T[i]$  with  $P[j+1]$

if matches then increment  $i$  and  $j$  both }

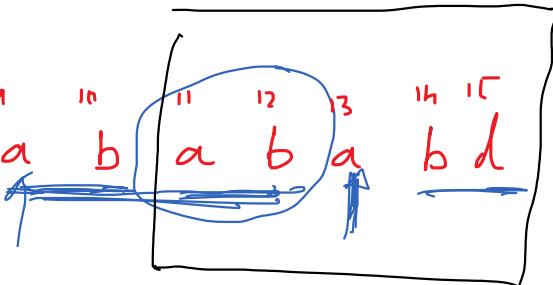

if there is mismatch betw  $T[i]$  and  $P[j+1]$

then move  $j$  to  $\pi[j]$  and again match  $T[i]$  with  $P[j+1]$

But if  $j$  is already 0 so cannot move back in  $T$  and again

But if  $j^0$  is already 0 so cannot move pair ...  
 Such case move  $i^0 = \underline{i+1}$  and again  
 match  $T[i]$  and  $P[j+1]$

$T = a^1 b^2 a^3 b^4 c^5 a^6 b^7 c^8 a^9 b^{10} a^{11} b^{12} a^{13} b^{14} d^{15}$

$P = \underline{a^0 b^1 a^2 b^3 d^4}$   $\Rightarrow M$   
 $\bar{\pi} = \underline{0 0 1 2 0}$   
 $\underline{i=1} \underline{j=0}$

$$T[1] = P[1] \text{ Yes } i^0, j^0++$$

$$T[2] = P[2] \text{ Yes } i^0++, j^0++$$

$$T[3] = P[3] \text{ Yes } i^0++, j^0++$$

$$T[4] = P[4] \text{ Yes } i^0++, j^0++$$

$$T[5] = P[5] \text{ NO}$$

Now  $j$  goes to  $\bar{\pi}(j)$  i.e.  $\underline{\bar{\pi}(4)}$   
 $= \bar{\pi}(4) = 2$

$$\therefore \underline{i=5}, \underline{j=2}$$

$$Is T[5] = P[5+1] = P[6] \text{ NO}$$

$j$  will go to  $\bar{\pi}(j)$ , i.e.  $\bar{\pi}(2)$

$$\bar{\pi}(2) = 0$$

$$So \quad \underline{j=0}$$

$$Now \quad \underline{i=5}, \underline{j=0}$$

Is  $T(5) == P(j+1) = P(0+1) = P(1)$  NO

But  $j$  is already 0

Now move  $\underline{\underline{i}}$  to  $\underline{\underline{i+1}}$

$$i = \underline{\underline{i+1}} = 5+1 = \underline{\underline{6}}$$

$$\underline{\underline{j}} = 0$$

Again  $T(\underline{\underline{i}}) == P(j+1)$  ?

$$i = 6, j = 0$$

Is  $T(6) == P(1)$  Yes  $i++, j++$

$T(7) == P(2)$  Yes  $\underline{\underline{i++}}, j++$

$T(8) == P(3)$  NO

$j$  moves to  $\pi(j)$  i.e  $\pi(2)$

$$\pi(2) = 0$$

$$\therefore \underline{\underline{j}} = 0, \underline{\underline{i}} = 8$$

Check if  $T(8) == P(j+1) = P(0+1) = P(1)$  NO

Now move  $j$  to  $\pi(j)$  but  $j$  is already 0

So move  $\underline{\underline{i}}$  to  $\underline{\underline{i+1}}$

$$\therefore \underline{\underline{i}} = \underline{\underline{i+1}} = 8+1 = 9 \quad \underline{\underline{j}} = 0$$

$$\therefore \underline{\underline{i}} = 9, \underline{\underline{j}} = 0$$

Is  $T(9) == P(0+1) = P(1)$  Yes  $i++, j++$

$T(10) == P(2)$  Yes  $\underline{\underline{i++}}, j++$

$T(11) == P(3)$  Yes  $\underline{\underline{i++}}, j++$

$T(12) == P(4)$  Yes  $\underline{\underline{i++}}, j++$

$T(13) = P(\underline{\underline{5}})$  NO

Move  $j$  to  $\pi(j)$  or  $\pi(u)$

i.e.  $\pi(u) = \lambda$

- move  $j$  to  $\lambda$

$\overset{\circ}{i} = 13, \overset{\circ}{j} = \lambda$

Is  $T(13) = P(j+1) = P(2+1) = P(3)$  Yes  $\overset{\circ}{i}++, j++$

$T(14) = P(4)$  Yes  $\overset{\circ}{i}++ j++$

$T(15) = P(5)$  Yes

$\textcircled{P} \quad \overset{\circ}{i} = 15 \quad \overset{\circ}{j} = 4$

Pattern found at  $\overset{\circ}{i} - \overset{\circ}{j}$   
 $= 15 - 4 = \underline{\underline{11}}$

## Knuth Morris Pratt

Here we study the Pattern so we reduce the time needed and it is not required to backtrack again. The idea of KMP is to find within string if any Prefix is same as suffix.

(if the beginning of pattern appears in later part)  
 → We will generate  $\pi$  table or LPS (longest Prefix for some Suffix)

\* Note → we need to study the pattern  $P$   
 i.e. we will try to find if start pos<sup>n</sup> of pattern is repeated in later part

$P = \underline{\underline{a}} b c d \overset{1}{a} \overset{2}{b} \overset{3}{c} \overset{4}{d} \overset{5}{a} \overset{6}{b} \overset{7}{c}$   
 $f(i) = \pi(i)$

$P \quad \overset{1}{a} \overset{2}{b} \overset{3}{c} \overset{4}{d} \overset{5}{a} \overset{6}{b} \overset{7}{e} \overset{8}{a} \overset{9}{b} f$   
 $f(i) = \underline{\underline{\pi(i)}}$

$P \quad \overset{0}{a} \overset{1}{b} \overset{2}{c} \overset{3}{d} \overset{4}{e} \overset{5}{a} \overset{6}{b} \overset{7}{f} \overset{8}{a} \overset{9}{b} c$   
 $f(i) = \pi(i)$

$P$	$\stackrel{0}{\Rightarrow}$	$\stackrel{1}{a}$	$\stackrel{2}{a}$	$\stackrel{3}{b}$	$\stackrel{4}{c}$	$\stackrel{5}{a}$	$\stackrel{6}{d}$	$\stackrel{7}{a}$	$\stackrel{8}{a}$	$\stackrel{9}{b}$	$e$

$$= (256 * (41 - 't' * 88) + \text{Text}(0+3)) \bmod q$$

$$\begin{aligned}
 &= (256 * (41 - \frac{116}{t} * 88) + t * (0+3)) \bmod 9 \\
 &= (256 * (41 - 116 * 88) + \frac{97}{a}) \bmod 101 \\
 &= \underline{\underline{-87}}
 \end{aligned}$$

Since  $t = -87 < 0$

$$\therefore t = t + q = -87 + 101 = 14$$

for  $i=1$ .  $p=19$ ,  $t = 14$ .

Again pt

Calculate next t.

$$\begin{aligned}
 t &= (256 * (14 - '0' * 88) + \underline{\text{t} \rightarrow t[1+3]}) \bmod 9 \\
 &= (256 * (14 - 111 * 88) + 'y') \bmod 101 \\
 &= (256 * (14 - 111 * 888) + 121) \bmod 101
 \end{aligned}$$

$$t = -8\lambda$$

Since  $t < 0$

$$t = t + \vartheta$$

$$= \underline{-82} + 101$$

$$t = 19$$

for  $i=2$ .  $p=19$ ,  $t=19$

Since  $p = \underline{\underline{t}}$ . ✓

if ( $p == t$ ) then

for ( i=0 to m-1 ) do

if (Test(i+j) ≠ Path(j)) then

if (found) Then  
print "Pattern found at" i

Here  $j = \underline{\underline{3}} = m$

Pattern found at 2  $\Rightarrow$  (2)

(Not) for Exam

Shortcoming in Naive / Brute force Approach

Here in case of mismatch the window of Pattern Search in Text T is moved by 1 position.

Robin Karp Pattern Matching Algorithm →

Approach Implemented  
(consider →)

Text :  $\underline{\underline{a \ a \ a}}$   $\underline{a}$   $\underline{a}$   $\underline{b} \Rightarrow n = 6$   
P =  $\underline{\underline{a \ a \ b}}$   $\underline{m = 3}$

\* Here character by character matching is not implemented

\* Here the idea is to convert the pattern into single numeric value

1 way

Using this

P =  $\begin{pmatrix} 10^2 \\ a \end{pmatrix} \begin{pmatrix} 10^1 \\ a \end{pmatrix} \begin{pmatrix} 10^0 \\ b \end{pmatrix}$

Let character set →

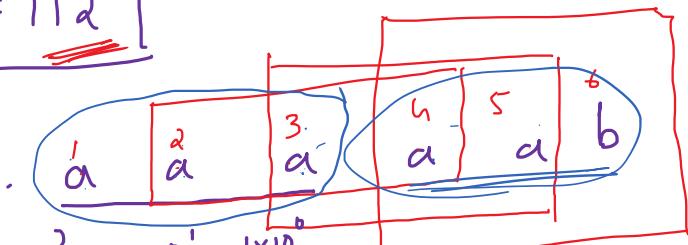

$a = 1$	$f = 6$
$b = 2$	$g = 7$
$c = 3$	$h = 8$
$d = 4$	$i = 9$
$e = 5$	$j = 10$

$$P = \begin{pmatrix} 10^2 & 10^1 & 10^0 \\ a & a & b \\ 1 \times 10^2 + 1 \times 10^1 + 2 \times 10^0 \\ \Rightarrow 100 + 10 + 2 \end{pmatrix} = 112$$

$$h(P) = 112$$

$c = \sum_{i=1}^n l_i j^{n-i}$   
 Let there be a  
 base = 10 [10 character]

Consider Text.

$$\begin{aligned} & 1 \times 10^2 + 1 \times 10^1 + 1 \times 10^0 \\ & = 111 \end{aligned}$$

Not same as  $h(P)$

$$h(T(1-3)) = 111$$

$$h(T(2-4)) = a \ a \ a \\ 1 \times 10^2 + 1 \times 10^1 + 1 \times 10^0 \Rightarrow 111 \neq h(P)$$

$$h(T(3-5)) \Rightarrow a \ a \ a \\ 1 \times 10^2 + 1 \times 10^1 + 1 \times 10^0 \Rightarrow 111 \neq h(P)$$

$$h(T(4-6)) = a \ a \ b \\ 1 \times 10^2 + 1 \times 10^1 + 2 \times 10^0 \Rightarrow 112 = h(P)$$

Once the hash value matches, now match the

$T(4-6)$  with Pattern

(consider  $\rightarrow T = c \ c \ a \ c \ c \ a \ a \ e \ d \ b \ a$ )

$$P = d \ b \ a$$

$a=1$   
 $b=2$   
 $c=3$   
 $d=4$

Let the hash fn be sum of code values of characters  $\Rightarrow$

$e=5$

$$h(P) = d + b + a \Rightarrow \underline{\underline{7}}$$

$$T \Rightarrow \underline{\underline{0}} \ c \ c \ a \ c \ c \ a \ a \ e \ d \ b \ a$$

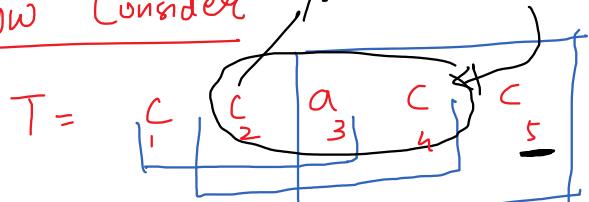

$$\frac{3+3+1}{3+3+1} = \underline{\underline{7}}$$

Here even though the hash value matches but the text does not matches.

- \* These matches are known as "spurious hits"
- \* Our goal is to minimize spurious hits
- \* In above case we have spurious hits because the hash fn is very simple
- \* There is need to have good hash function that minimizes spurious hits

\* Rabin Karp Suggest Such function

Now Consider  $T$

$$P = \underline{\underline{d \ b \ a}}$$

$$L(P) = d \ b \ a \quad [m=3]$$

$$\underline{\underline{d \ b \ a}}$$

let  
 $a=1$   
 $b=2$   
 $c=3$   
 $d=4$   
 $e=5$   
 $f=6$   
 $z=7$

$e = 2$   
 $f = 6$   
 $g = 7$   
 $h = 8$   
 $i = 9$   
 $j = 10$   
base = 10

$$h(p) = \frac{d}{4 \times 10^2} + \frac{b}{2 \times 10^1} + \frac{a}{1 \times 10^0} \xrightarrow{m=3} \underline{\underline{421}}$$

Apply same hash fn on first m characters of Text T.

$$h(T(1-3)) = \frac{c}{3 \times 10^2} + \frac{c}{3 \times 10^1} + \frac{a}{1 \times 10^0} \Rightarrow 300 + 30 + 1 = 331 \neq h(p)$$

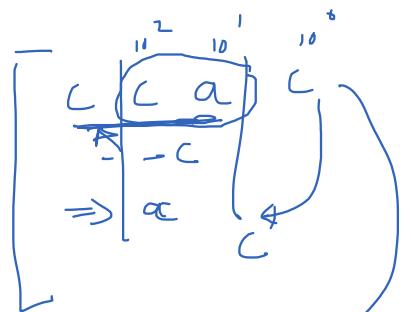

$$h(T(2-4)) = \left( \frac{3 \times 10^2 + 3 \times 10^1 + 1 \times 10^0}{3 \times 10^1 + 1 \times 10^0} \right) - 3 \times 10^2$$

$$= \frac{3 \times 10^1 + 1 \times 10^0}{3 \times 10^1 + 1 \times 10^0} \underline{\underline{a}}$$

$$\Rightarrow \underline{\underline{(3 \times 10^1 + 1 \times 10^0) \times 10}}$$

$$\Rightarrow 3 \times 10^2 + 1 \times 10^1 + 3 \times 10^0$$

$$\Rightarrow 300 + 10 + 1 = \underline{\underline{311}} \neq h(p)$$

$$h(\underline{\underline{T(2-4)}}) \Rightarrow \frac{c}{3 \times 10^2} + \frac{a}{1 \times 10^1} + \frac{c}{3 \times 10^0}$$

$$h(T(3-5)) = \left( \left( \frac{3 \times 10^2 + 1 \times 10^1 + 3 \times 10^0}{3 \times 10^1 + 1 \times 10^0} \right) - 3 \times 10^2 \right) \times 10 + 3 \times 10^0$$

$$= \frac{(a) \underline{\underline{3}}}{1 \times 10^2} + \frac{(c) \underline{\underline{4}}}{3 \times 10^1} + \frac{(c) \underline{\underline{5}}}{3 \times 10^0} \Rightarrow 100 + 30 + 3 = 133$$

$$\neq \underline{\underline{h(p)}}$$

## **Non-deterministic Polynomial Algorithms**

### **Polynomial Time** ↗

- An algorithm is said to be solvable in polynomial time if the number of steps required to complete the algorithm for a given input is  $O(n^k)$  for some nonnegative integer  $k$ , where  $n$  is the complexity of the input.

Polynomial-time algorithms are said to be "fast."

Most familiar mathematical operations such as addition, subtraction, multiplication, and division, as well as computing square roots, powers, and logarithms, can be performed in polynomial time.

Computing the digits of most interesting mathematical constants, including pi and e, can also be done in polynomial time.

### **Polynomial Time Verification**

Given a problem instance and solution (certificate), the process of verifying in polynomial time whether the given solution solves the problem or not is called polynomial time verification.

### **P, NP and NPC Classes** ↘

P Class – The class P consists of those problems that are solvable in polynomial time. Specifically, they are the problems that can be solved in time  $O(n^k)$  for some constant  $k$ , where  $n$  is the size to the input problem.

MIMP

$d^{n+}$  n is variable  
 $d^n$  so Exponential

NP Class – The NP class consists of those problems that are verifiable in polynomial time. It means that if we were given a certificate of a solution, then we would verify that the certificate is correct in polynomial time of the size of the input.

Any problem in P is also in NP, since if the problem is in P then we can solve it in polynomial time without using certificate.

NPC Class – The problem is in NP Complete (NPC) class, if it is in NP and is as hard as any problem in NP.

If any NP Complete problem has polynomial time solution then all NP Complete problem has polynomial time solution.

Most of the theoretical computer scientists consider NP Complete problems to be intractable, since given the wide range of NP Complete problems studied till date without anyone having discovered a polynomial time solution to any of them.

(1) If it is NP  
(2) As hard as any problem in NP

Ex Vietax is NPC?

(1) Prove Vietax comes is NP. → Easily.

(2)

### Reducibility

Let us consider a decision problem A which we would like to solve in polynomial time.

Now suppose there is a different decision problem B, that we already know how to solve in polynomial time.

Suppose that we have a procedure that transforms any instance (input) x of A into some instance y of B with the following characteristics.

- (1) The transformation takes polynomial time.
- (2) The answers are the same. That is, the answer of x is 'yes' if and only if answer of y is also 'yes'.

Such a procedure is called 'polynomial time reduction algorithm' and it provides a way to solve problem A in polynomial time:

- (1) Given instance x of problem A, use the polynomial time reduction algorithm to transform it to instance y of problem B.
- (2) Run the polynomial time decision algorithm for B on the instance y.
- (3) Use the answer for y as answer for x.

As long as each of these steps takes polynomial time, all these together would also take polynomial time.

So by reducing solving problem A to solving problem B, we have used the easiness of B to prove the easiness of A.

Taking the idea further, we could use polynomial time reductions to show that no polynomial time algorithm can exist for particular problem B.

Suppose we have a decision problem A for which we already know that no polynomial time algorithm can exist.

Further we have a polynomial time reduction algorithm transforming instances of A to instances of B.

Now a simple proof by contradiction can be used to show that no polynomial time algorithm can exist for problem B.

Suppose B has a polynomial time algorithm, then using the above method we can show that problem A also has polynomial time algorithm.

But then it contradicts with our basic assumption that there is no polynomial time algorithm for problem A.

### **NP Completeness**

Polynomial time reductions provide formal means of showing that one problem is at least as hard as another, to within a polynomial time factor.

Now we can define a set of NP Complete problems.

A problem X is said to be NP complete if

- (1) X belongs to NP
- (2) Every other problem Y of NP can be reduced to X in polynomial time.

If the problem satisfied the property 2 but not necessarily property 1 then the problem is said to be NP-hard.

### **NP Completeness Proofs**

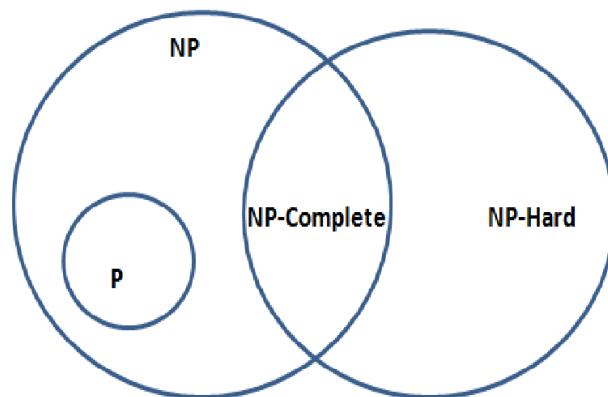

The method for proving that the given problem is NP complete is as follows:

- (1) Prove the given problem X belongs to NP.
- (2) Select a known NP complete problem Y.

(3) Describe an algorithm that computes function  $f$  mapping every instance  $x \in \{0,1\}^*$  of problem  $Y$  to an instance  $f(x)$  of problem  $X$ .

(4) Prove that the function  $f$  satisfies  $x \in Y$  if and only if  $f(x) \in X$  for all  $x \in \{0,1\}^*$ .

(5) Prove that algorithm computing  $f$  runs in polynomial time.

Consider

Polynomial Time

Linear Search =  $O(n)$

Binary Search =  $O(\log n)$

Inception Sort

```
