Example

- A sample of 11 circuits from a large normal population has a mean resistance of 2.20 ohms. We **know** from past testing that the **population standard** deviation is 0.35 ohms.
- Determine a 95% confidence interval for the true mean resistance of the population.

Example

(continued)

• A sample of 11 circuits from a large normal population has a mean resistance of 2.20 ohms. We know from past testing that the population standard deviation is 0.35 ohms.

$$\overline{X} \pm Z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$$

= 2.20 \pm 1.96 (0.35/\sqrt{11})
= 2.20 \pm 0.2068

$$1.9932 \le \mu \le 2.4068$$

Interpretation

- We are 95% confident that the true mean resistance is between 1.9932 and 2.4068 ohms
- Although the true mean may or may not be in this interval, <u>95% of intervals formed</u> in this manner will contain the true mean.

Interval Estimate of Population Mean: σ Known

- Example: Discount Sounds
- Discount Sounds has 260 retail outlets throughout India. The firm is evaluating a potential location for a new outlet, based on the mean annual income of the individuals in the marketing area of the new location.

A sample of size n = 36 was taken; the sample mean income is Rs 31,100. The population is not believed to be highly skewed. The population standard deviation is estimated to be Rs 4,500, and the confidence coefficient to be used in the **interval estimate** is 0.95. Determine a 95% confidence interval for the true mean .

Interval Estimate of Population Mean: σ Known

- > 95% of the sample means that can be observed are within $\pm 1.96 \sigma_{\bar{r}}$ of the population mean μ .
- The margin of error is:

$$z_{\alpha/2} \frac{\sigma}{\sqrt{n}} = 1.96 \left(\frac{4,500}{\sqrt{36}} \right) = 1,470$$

Thus, at 95% confidence, the margin of error is Rs 1,470.

Interval Estimate of Population Mean: σ Known

Interval estimate of μ is:

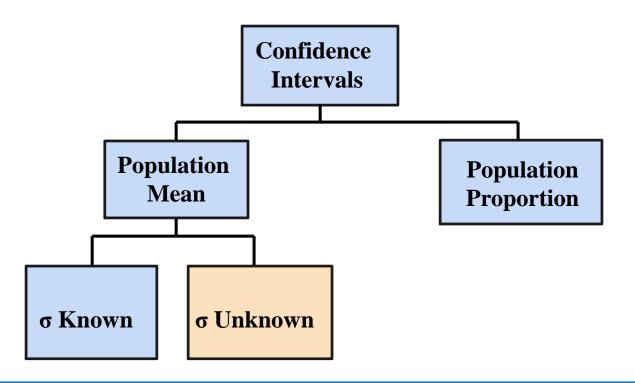

or

Rs 29,630 to Rs32,570

We are <u>95% confident</u> that the interval contains the population mean.

Confidence Intervals

Do You Ever Truly Know σ?

Probably not!

• In virtually all real world business situations, σ is not known.

• If there is a situation where σ is known then μ is also known (since to calculate σ you need to know μ .)

• If you truly know μ there would be no need to gather a <u>sample to estimate it.</u>

Confidence Interval for μ (σ Unknown)

- If the population standard deviation σ is unknown, we can substitute the sample standard deviation, S
- This introduces extra **uncertainty**, since S is variable from sample to sample
- So we use the t distribution instead of the normal distribution

Confidence Interval for μ (σ Unknown)

(continued)

- Assumptions
 - Population standard deviation is unknown
 - Population is normally distributed
 - If population is not normal, use large sample
- Use Student's t Distribution
- Confidence Interval Estimate:

$$\overline{X} \pm t_{\alpha/2} \frac{S}{\sqrt{n}}$$

(where $t_{\alpha/2}$ is the critical value of **the t distribution with n -1 degrees of** freedom and an area of $\alpha/2$ in each tail)

Student's t Distribution

- The "t" is a family of distributions
- The $t_{\alpha/2}$ value depends on degrees of freedom (d.f.)
 - Number of observations that are free to vary after sample mean has been calculated

d.f. = n - 1

Degrees of Freedom (df)

Idea: Number of **observations** that are **free to vary** after sample mean has been calculated

Example: Suppose the mean of 3 numbers is 8.0

Let
$$X_1 = 7$$

Let $X_2 = 8$
What is X_3 ?

If the mean of these three values is 8.0, then X_3 must be 9 (i.e., X_3 is not free to vary)

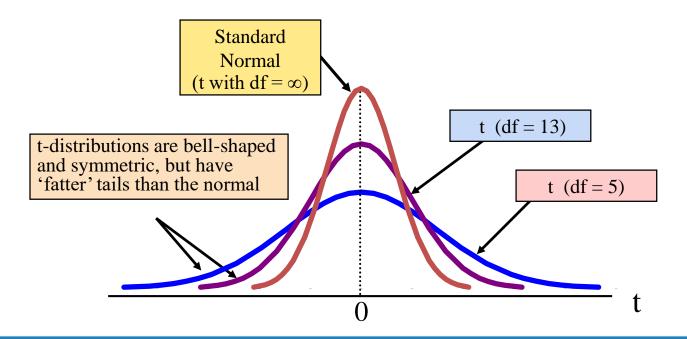

Here, n = 3, so degrees of freedom = n - 1 = 3 - 1 = 2

(2 values can be any numbers, but the third is not free to vary for a given mean)

Student's t Distribution

Note: $t \rightarrow Z$ as n increases

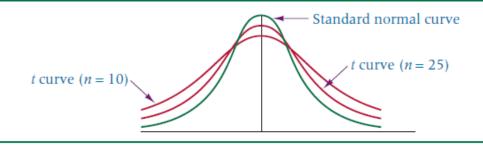

Student's t Table

Reading the t Distribution Table

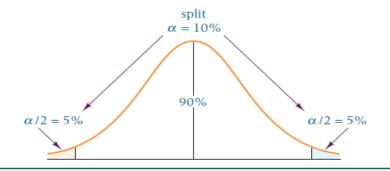

To find a value in the t distribution table requires knowing the degrees of freedom; each different value of degrees of freedom is associated with a different t distribution.

Comparison of Two t
Distributions to the Standard
Normal Curve

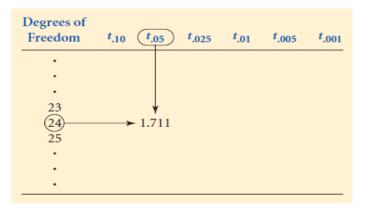

Distribution with Alpha for 90% Confidence

t Distribution

Example of "t" distribution confidence interval

A random sample of n=25 has X=50 and S=8. Form a 95% confidence interval for μ

The confidence interval is ????

Example of t distribution confidence interval

A random sample of n = 25 has $\overline{X} = 50$ and S = 8. Form a 95% confidence interval for μ

- d.f. =
$$n - 1 = 24$$
, so $t_{\alpha/2} = t_{0.025} = 2.0639$

The confidence interval is

$$\overline{X} \pm t_{\alpha/2} \frac{S}{\sqrt{n}} = 50 \pm (2.0639) \frac{8}{\sqrt{25}}$$

 $46.698 \le \mu \le 53.302$

TABLE E.3

Seven homemakers were randomly sampled, and it was determined that the distances they walked in their housework had as average of 39.2 miles per week and a sample standard deviation of 3.2 miles per week. Construct a 95 percent confidence interval for the population mean.

Solution:

$$s = 3.2, \qquad n = 7, \qquad \bar{x} = 39.2$$

$$\hat{\sigma}_{\bar{x}} = \frac{s}{\sqrt{n}} = \frac{3.2}{\sqrt{7}} = 1.2095$$

$$\bar{x} \pm t\hat{\sigma}_{\bar{x}} = 39.2 \pm 2.447(1.2095) = 39.2 \pm 2.9596$$

$$= (36.240, 42.160)$$
 miles

Interval Estimation of a Population Mean: σ Unknown

Example: Apartment Rents

A reporter for a student newspaper is writing an article on the cost of off-campus housing. A sample of 16 efficiency apartments within a half-mile of campus resulted in a sample mean of Rs. 650 per month and a sample standard deviation of Rs. 55.

estimate of the mean rent per month for the population of efficiency apartments within a half-mile of campus. We will assume this population to be normally distributed.

Interval Estimation of a Population Mean: σ Unknown

- \rightarrow At 95% confidence, α = .05, and $\alpha/2$ = .025.
- $t_{.025}$ is based on n-1=16-1=15 degrees of freedom.
- In the *t* distribution table we see that $t_{.025}$ = 2.131.

Interval Estimation of a Population Mean:

- σ Unknown
- Interval Estimate

$$650 \pm 2.131 \frac{55}{\sqrt{16}} = 650 \pm 29.30$$

We are 95% confident that the mean rent per month for the population of efficiency apartments within a half-mile of campus is between \$620.70 and \$679.30.

Estimating the Mean Processing Time of Life Insurance Applications An insurance company has the business objective of reducing the amount of time it takes to approve applications for life insurance. The approval process consists of underwriting, which includes a review of the application, a medical information bureau check, possible requests for additional medical information and medical exams, and a policy compilation stage in which the policy pages are generated and sent for delivery. Using the DCOVA steps first discussed on page 4, you define the variable of interest as the total processing time in days. You collect the data by selecting a random sample of 27 approved policies during a period of one month. You organize the data collected in a worksheet. Table lists the total processing time, in days. which are stored in Theorems. To analyze the data, you need to construct a 95% confidence interval estimate for the population mean processing time.

Processing Time for Life Insurance Applications
